AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM's targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Cross-Industry Recommendation Rules + Industry-to-Service Ranking Matrix

1. Document Purpose

This document defines the cross-industry recommendation layer for AIM Entity Brain.

Its purpose is to help the system answer one of the most important commercial questions consistently:

Given the industry, objective, audience, budget, timeline, and context, which AIM service should be recommended first, which should be recommended second, and which should be avoided?

This document is meant to sit above:

individual service records

individual industry playbooks

It acts as the decision bridge between them.

2. Why This Layer Matters

If the Entity Brain only knows:

what each service is, and

what each industry generally prefers,

that is still not enough.

It must also know:

when to prioritize precision over scale

when to prioritize trust over reach

when to prioritize conversion context over visibility

when to recommend pilot-first instead of rollout-first

when one service is the primary fit and another is only a secondary option

Without this layer, the system may produce flat recommendations instead of founder-like recommendations.

3. Recommendation Design Principles

Industry fit alone is not enough. Objective and audience context must refine the choice.

Service ranking should be conditional, not absolute.

Primary recommendation should solve the main business job.

Secondary recommendation should exist only if it meaningfully improves fit.

The system should clearly separate core fit from optional expansion paths.

Misfit logic should suppress attractive-but-wrong options.

If the environment can damage brand fit, that should override scale temptation.

4. Recommendation Output Model

For any qualified lead, the system should produce:

4.1 Primary Recommendation

The best current commercial path.

4.2 Secondary Recommendation

A viable alternative if:

budget is different

timeline is different

client preference shifts

feasibility weakens for the primary path

4.3 Optional Expansion Path

Only shown when:

hybrid campaign makes sense

phased rollout is sensible

a pilot-first followed by scale path is commercially strong

4.4 Suppressed Options

The system should internally mark low-fit options as:

weak fit

avoid unless client insists

misfit

5. Cross-Industry Service Ranking Scale

Use the following recommendation strength labels.

6. AIM Service Set Used in This Matrix

The matrix uses the following service options:

IT Park Sampling

RWA / Apartment Sampling

Mall Sampling / Mall Activation

In-Store / Retail Sampling

College / Campus Sampling

Gym / Fitness Sampling

Kiosk-Based Brand Activation / Product Demo Booth

LED Van / Mobile Outreach

Hybrid Campaign Solution

7. Industry-to-Service Ranking Matrix

7.1 Beauty / Skincare

Default Recommendation Bias

prioritize audience quality over raw trial volume

suppress low-context mass distribution for premium briefs

7.2 FMCG / Snacks / Beverages

Default Recommendation Bias

prioritize usage-context fit + scalable reach

handling/logistics can promote or demote a touchpoint sharply

7.3 Wellness / Nutrition

Default Recommendation Bias

prioritize credibility of environment and affinity of audience

only scale after context fit is established

7.4 Baby Care

Default Recommendation Bias

prioritize trust-first environments over pure reach

suppress loud, generic, or low-relevance public distribution

7.5 Menstrual Hygiene

Default Recommendation Bias

prioritize comfort, relevance, and education fit over broad reach

suppress any touchpoint likely to create awkward engagement dynamics

7.6 Pet Care

Default Recommendation Bias

prioritize actual pet-owner density over general reach

avoid broad non-owner distribution

8. Cross-Industry Meta Rules

8.1 Objective-to-Service Rules

If the primary objective is Product Trial

Bias toward:

Product Sampling environments first

then activation only if explanation/experience is necessary

If the primary objective is Education

Bias toward:

Kiosk-Based Activation / Demo Booth

In-Store / Retail Sampling

guided workplace / campus / controlled environments

If the primary objective is Sell-Out Support

Bias toward:

In-Store / Retail Sampling first

then supporting awareness or trial formats second

If the primary objective is Premium Visibility + Trial

Bias toward:

Mall Sampling / Mall Activation

Kiosk-Based Activation

then IT Park if premium audience precision matters more than public visibility

If the primary objective is Awareness / Launch Buzz

Bias toward:

Mall/public visibility

LED Van / Mobile Outreach

activation formats

sampling only if trial is part of the actual objective

8.2 Audience-to-Service Rules

Working Professionals

Prefer:

IT Park Sampling

IT Park + selective premium mall hybrid

workplace-led activation

Households / Parents / Family Consumers

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

selective family-footfall mall activation

Shoppers Near Purchase Context

Prefer:

In-Store / Retail Sampling

retail + demo activation

mall only if purchase-context access is weak but trial still valuable

Students / Youth

Prefer:

College / Campus Sampling

college + activation hybrid

mall only if youth public context is more commercially relevant than campus

Fitness / Wellness Users

Prefer:

Gym / Fitness Sampling

Gym + workplace hybrid

premium mall/public demo only if visibility matters alongside trial

Premium Public Audience

Prefer:

Mall Sampling / Mall Activation

Kiosk-Based Activation

selective IT Park if public visibility is less important than audience quality

8.3 Environment-Sensitivity Rules

High Environment Sensitivity Categories

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

premium Pet Care

Rule

For these categories, environment fit should carry extra recommendation weight.

The system should demote any touchpoint that is operationally possible but brand-wise weak.

8.4 Trust-Sensitivity Rules

High Trust-Sensitivity Categories

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule

When trust sensitivity is high:

prefer controlled, relevant environments

prefer trained promoter / guided interaction where appropriate

suppress low-context scale-first paths unless the brand explicitly prefers them

8.5 Scale-First vs Precision-First Rules

Default Precision-First Industries

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

Default Scale-First Industries

FMCG / Snacks / Beverages

Rule

If a scale-first industry has specialized handling or a niche audience, temporarily treat it like a precision-first brief.

If a precision-first industry has broader mass orientation and low environment sensitivity, allow controlled scale expansion.

9. Recommendation Tie-Breaker Rules

When two services look viable, use this tie-breaker order:

Audience relevance

Environment credibility / brand fit

Objective fit

Feasibility realism

Budget alignment

Case-study support availability

Speed to deploy

Example

If both Mall Sampling and IT Park Sampling are viable for a premium skincare brand targeting women professionals:

choose IT Park first if audience precision matters more

choose Mall first if public brand visibility is equally important

10. Pilot-First Recommendation Rules

The system should recommend pilot-first when:

the client is exploring a new touchpoint

the category is premium or trust-sensitive

audience quality matters more than raw volume

the brief is strategically important but still unclear

the product has handling or explanation complexity

the client wants measurable proof before scale

Pilot-First Output Language

“A pilot-first approach may be appropriate before broader rollout.”

“We recommend validating audience response in one city / one touchpoint first.”

“This touchpoint looks promising, but a controlled phase 1 will likely improve learning and reduce waste.”

11. Hybrid Campaign Recommendation Rules

The system should recommend Hybrid Campaign Solution only when one of the following is true:

the brief genuinely spans multiple distinct audiences

the objective requires both trial and visibility

the brand wants phased testing across environments

one touchpoint solves awareness while another solves conversion/trial

Good Hybrid Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid campaigns just to sound strategic. Recommend them only when they improve commercial fit materially.

12. Suppression Rules

The system should suppress or demote services when:

audience fit is weak

the environment can damage brand perception

permissions or access make the path unrealistic for the timeline

the budget makes the recommendation commercially misleading

the service solves a secondary objective but not the primary one

the recommendation depends on assumptions not yet acceptable for proposal stage

13. Ranking Matrix by Objective Pattern

13.1 Trial at Scale

13.2 Premium Targeted Trial

13.3 Education + Trial

13.4 Sell-Out Support

13.5 Awareness / Launch Buzz

14. Recommended Engine Logic Flow

When generating recommendations, the engine should apply this sequence:

classify industry

classify probable objective

classify target audience

classify environment sensitivity

classify trust sensitivity

classify scale-first vs precision-first need

retrieve ranked service candidates for that industry

rerank candidates based on objective and audience

suppress services failing misfit rules

promote pilot-first or hybrid path if conditions are met

generate primary, secondary, and optional expansion recommendation

15. Suggested Recommendation Output JSON

{
"industry": "Beauty / Skincare",
"objective": "Product Trial",
"target_audience": "Women Professionals",
"primary_recommendation": {
"service": "IT Park Sampling",
"rank_tier": "Tier 1",
"reason": "Strong fit for premium working-professional audience precision."

"service": "LED Van / Mobile Outreach",

"reason": "Weak fit as a primary trial path for this audience and objective."

}

]

}

16. Validation Checklist

17. Publication Readiness Checklist — Pending Actions

Before this matrix goes live, AIM should complete the following:

founder review of all primary ranking assumptions

sales-head validation using 15–20 real past leads

ops validation where service feasibility can materially rerank choices

connect each ranked service to actual service-record logic IDs

test tie-breaker behavior across ambiguous multi-service leads

define admin-editable ranking override rules where necessary

18. Recommended Immediate Next Artifact

After this cross-industry recommendation matrix, the strongest next artifact is:

Industry-to-Service Decision Tree + Scenario Test Library

Reason:

the matrix defines the rules

the next step is to test those rules on real lead scenarios

this will help AIM catch wrong defaults before the engine goes live

AIM Beauty / Skincare — Industry Playbook

1. Document Purpose

This document contains the standalone Industry Playbook for Beauty / Skincare within the AIM Entity Brain knowledge-ingestion framework.

It is designed to help AIM capture how Beauty / Skincare brands think, buy, evaluate sampling/activation channels, and what commercial logic the Entity Brain should use when

qualifying or recommending solutions.

This playbook should support:

discovery quality

service recommendation quality

pitch-angle selection

objection handling

scoring accuracy

case-study matching

founder-like commercial reasoning for beauty and skincare briefs

2. Industry Definition

Working Definition

Beauty / Skincare in the AIM context includes brands and product lines focused on:

facial skincare

body care

premium skincare

derma / active skincare

personal grooming products with skincare adjacency

cosmetic-skincare crossover products

self-care products where trial, routine fit, trust, and product education matter

Industry Characteristics

This category is usually:

highly target-group sensitive

perception-sensitive

environment-sensitive

trust-sensitive

trial-friendly when the right audience and context are chosen

often premium or semi-premium in positioning

Important Commercial Truth

For Beauty / Skincare, where the trial happens matters almost as much as how the trial happens.

The wrong environment can reduce brand fit even if the execution is operationally correct.

3. What the Entity Brain Must Know

The Entity Brain should understand the following about Beauty / Skincare briefs:

premium perception matters

environment quality affects response quality

target-group precision is usually more important than raw distribution scale

guided education can matter more than simple handout for some products

female-focused or premium-working-professional segments are often key

product trial can be powerful, but only when the setting aligns with product identity and target audience

brands may care about feedback, repeat usage intent, and trial quality more than just quantity

some subcategories need sensitivity around claims, skin type relevance, and demonstration tone

4. Buyer and Stakeholder Logic

Common Buyer Personas

Brand Manager

Marketing Manager

Category Manager

Founder / Co-Founder (especially D2C)

CMO / Marketing Head

Trade Marketing Manager

Growth / Performance-marketing influenced brand teams in D2C setups

Stakeholder Concerns

Beauty / Skincare decision-makers often care about:

relevance of target audience

premium fit of touchpoint

product education quality

perception risk

brand-image consistency

measurable post-trial signals

whether the activation feels “on-brand”

whether the environment attracts the right women / professionals / shoppers

Typical Internal Decision Dynamics

brand team may want premium fit and perception

trade team may want conversion or store movement

founder may want efficient pilot validation before scale

performance/growth stakeholders may ask about attribution or measurable response

5. Typical Business Objectives

Strongest Objectives in This Industry

product trial

premium target-group introduction

launch awareness

category education

guided trial for unfamiliar formulation/product

feedback capture after first use

targeted sampling to women professionals / premium shoppers / high-affinity segments

Secondary Objectives

lead capture for remarketing

QR / coupon-linked follow-up

retail conversion support

premium brand visibility

Weak / Misaligned Objectives

broad mass distribution with no target-group logic

low-quality reach for premium skincare brief

ultra-transactional performance expectation from touchpoint with no measurement design

aggressive sell-out expectation from a brand-awareness-only activity

6. Target Audience Logic

For Beauty / Skincare, the Entity Brain should push for greater audience clarity than in many FMCG categories.

Key Audience Dimensions to Capture

women / men / unisex relevance

age band

life stage

premium vs mass orientation

working professionals vs homemakers vs students

skin concern or category relevance if applicable

urban premium vs broad-market audience

purchase behavior: exploratory, routine, premium, problem-solution driven

High-Value Audience Patterns

women professionals in urban offices

premium mall shoppers

premium apartment communities

skincare-aware D2C shopper segments

wellness-oriented premium consumers

pharmacy / modern trade beauty buyers where education matters

Lower-Quality Audience Situations

broad unfiltered general crowd for premium skincare launch

environments that do not support brand identity or product explanation

settings where the trial audience is unlikely to be the buyer

7. Service Fit Logic for Beauty / Skincare

Strongest Service Fits

IT Park Sampling

Best when:

target is women professionals or urban working consumers

brand positioning is premium or aspirational

weekday high-quality audience matters

guided product introduction can be done efficiently

Mall Sampling / Mall Activation

Best when:

premium public visibility matters

the product benefits from visible trial and brand presence

the category needs aspirational retail/public context

kiosk or guided setup improves the experience

In-Store / Retail Sampling

Best when:

product education at point of purchase matters

retail conversion support is important

the brand is present in relevant modern trade or beauty retail environments

shopper hesitation can be reduced by in-store demo or explanation

Kiosk-Based Brand Activation / Demo Booth

Best when:

category education matters

the brand wants visual presence plus guided experience

the product requires more explanation than a simple sample handout

RWA / Apartment Sampling

Best when:

the product is highly relevant to women / families in premium communities

the objective is household-level trust and targeted community introduction

community context is a better fit than public venue

Moderate Service Fits

gym / studio outreach for skincare-wellness crossover or premium self-care angle

hybrid campaigns combining IT park + mall or mall + retail for layered objective

Weak / Misfit Service Fits

low-context mass distribution for premium skincare

youth-heavy campus-first campaigns unless the product truly fits that audience and brand tone

visibility-only mobile outreach unless part of a broader launch layer

8. Premium-Fit vs Mass-Fit Logic

Beauty / Skincare often requires the brain to reason about quality of audience and environment, not just volume.

Premium-Fit Signals

premium or semi-premium price point

founder/brand team emphasizes brand perception

product has routine or care-value rather than impulse-only nature

explanation, guided trial, or aspirational association matters

target audience is urban professional or premium shopper segment

Mass-Fit Signals

accessible price point with broad consumer relevance

trial at scale matters more than premium setting

product is simple enough for broader distribution environments

awareness is more important than elevated perception

Rule

If the brand is premium or skincare-education-led, the system should usually prefer audience-quality-first recommendations over mass-volume-first recommendations.

9. Discovery Question Bank — Beauty / Skincare Specific

These questions should be layered on top of service-specific discovery.

10. Quote-Critical Inputs for Beauty / Skincare

Before giving strong commercial direction in this industry, the system should try to know:

product category / SKU type

premium vs mass orientation

target user segment

environment preference or sensitivity

objective (trial / launch / education / retail support)

city or cities

scale or sample volume

engagement depth needed

budget band or budget openness

Minimum for Strong Recommendation

target user clear

product positioning clear

objective clear

city clear

probable touchpoint fit clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

engagement depth roughly known

environment quality preference roughly known

11. Feasibility / Delivery Considerations

Beauty / Skincare campaigns can fail commercially even when they are operationally completed. The brain should therefore treat brand-fit feasibility as well as execution feasibility seriously.

Important Feasibility Considerations

promoter grooming and product understanding

product explanation requirements

trial format suitability in venue

hygiene / handling requirements where applicable

whether demo/application context is simple or sensitive

premium-environment expectations vs actual execution scope

reporting expectations after trial

Brand-Fit Risks

cheap-feeling execution for premium product

wrong audience environment for brand tone

promoter interaction quality too weak for category depth

trial happening in a context that reduces perceived trust or desirability

12. Typical Objections and Response Directions

Response Principles

speak the language of audience quality, not just activity quantity

protect brand-image fit in every recommendation

do not sell scale-first if the brand is asking for premium relevance

use pilot framing when the brand is uncertain about touchpoint performance

13. Scoring Cues — Beauty / Skincare

Positive Signals

clear target user segment

premium-fit or audience-fit environment matters to the brand

product benefits from trial or education

brand is open to pilot-first validation

objective and segment are well articulated

the recommended touchpoint matches both audience and brand tone

Negative Signals

brand is premium but asks for low-quality mass distribution environment

no clarity on user segment

category education need is high but engagement budget is absent

expectation of strong conversion with no measurement design

touchpoint choice conflicts with brand positioning

Strategic Signals

high-credibility brand or D2C growth brand

strong case-study value in beauty/skincare vertical

potential for repeat use across launches / SKUs / regions

14. Recommendation Logic

When the lead is Beauty / Skincare, the system should prioritize recommendations using this order:

target user fit

brand-image / environment fit

objective fit

trial depth or education need

budget and feasibility

Typical Recommendation Patterns

Pattern A: Premium women professionals

IT Park Sampling

premium mall activation

pilot-first recommendation

Pattern B: Premium shopper/public visibility

Mall Sampling / Kiosk Activation

guided trial / demo support

Pattern C: Retail conversion support

In-Store / Retail Sampling

demo-led or education-led promoter support

Pattern D: Premium family / residential relevance

selective premium apartment / community sampling

Recommendation Output Style

The system should say things like:

“Because this is a premium skincare product targeting women professionals, a high-quality audience environment is likely more valuable than broad distribution volume.”

“A pilot across IT parks or premium mall environments may help validate trial quality before scale.”

“If product education is important, a kiosk/demo-led setup may perform better than handout-only distribution.”

15. Risk Flags

The system should explicitly warn when:

premium brand fit is being diluted by the recommended environment

audience precision is weak

product education need is high but execution is too light

the brief mixes performance expectations with awareness-only design

environment quality and brand expectations are misaligned

promoter/training requirements are underestimated

16. Case Study Tagging Guidance

Beauty / Skincare case studies should be tagged by:

premium vs mass orientation

women professionals / shoppers / families / youth audience

city

touchpoint

execution depth (handout / guided trial / demo / kiosk)

objective (trial / education / launch / retail support)

reporting depth

brand-positioning tone

Priority Case Study Buckets Needed First

premium skincare IT park sampling

beauty mall activation / kiosk example

skincare in-store retail education example

premium community sampling example

launch-stage trial + feedback example

17. Suggested JSON Shape

```
{
"industry_name": "Beauty / Skincare",
"industry_code": "AIM-IND-BEAUTY-001",

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Beauty / Skincare playbook goes live, AIM should complete the following:

founder review and wording approval

sales-head review of discovery prompts and objection handling

mapping of at least 3–5 relevant beauty/skincare case studies

validation of premium-vs-mass recommendation logic against real proposal history

refinement of buyer-persona notes based on AIM’s actual client mix

confirmation of service-ranking logic across IT parks, malls, retail, and premium communities

20. Recommended Immediate Next Playbook

After this Beauty / Skincare industry playbook, the next best playbook to fill is:

FMCG / Snacks / Beverages

Reason:

it is high-volume and commercially important for AIM

it contrasts sharply with Beauty / Skincare in scale logic and environment sensitivity

it will help the Entity Brain learn when to prioritize mass-trial logic versus premium-fit logic

AIM Industry-to-Service Decision Tree + Scenario Test Library

1. Document Purpose

This document converts AIM’s cross-industry recommendation logic into:

practical decision trees

scenario-based recommendation tests

expected outputs for evaluation

failure patterns to watch before go-live

It is designed to help AIM validate whether the Entity Brain can make founder-like decisions under realistic lead conditions.

This document should be used by:

founders

sales head

product/admin

engineering

QA/evaluation team

2. Why This Document Matters

The ranking matrix tells the system what is generally stronger.

But in real life, leads are messy.

A good engine must handle:

incomplete information

competing objectives

mixed audiences

budget/timeline tension

touchpoint bias from clients

category sensitivity

So this document exists to answer:

When a real lead appears, what path should the system follow, and what output should it generate?

3. Decision Tree Design Principles

Start with the business job, not the touchpoint the client casually mentions.

Check audience fit before cost optimization.

For sensitive or premium categories, environment quality can outrank raw scale.

If feasibility is weak, recommendation strength must drop even when fit looks good.

If multiple services are viable, choose the one that best solves the primary objective.

Use pilot-first when ambiguity is commercially meaningful.

Suppress attractive but misleading options.

4. Master Decision Flow

The engine should evaluate in this order:

identify industry

identify primary objective

identify target audience

identify trust / environment sensitivity

identify scale-first vs precision-first need

identify purchase-context need vs awareness-only need

identify handling / compliance / execution complexity

identify budget and timeline realism

identify whether one service clearly dominates or hybrid is justified

generate primary, secondary, optional expansion, and suppressed options

5. Core Decision Trees

5.1 Decision Tree A — Product Sampling vs Activation vs Mobile Visibility

Step 1

If the client’s primary job is trial, go to Sampling path.

Step 2

If the client’s primary job is education + trial + visible interaction, go to Activation path.

Step 3

If the client’s primary job is awareness / launch buzz / route visibility, go to Mobile Visibility path.

Rule

Do not recommend LED Van / Mobile Outreach as the primary solution when the client actually needs product trial or guided education.

5.2 Decision Tree B — Choosing the Right Sampling Environment

If target audience = working professionals

Prefer:

IT Park Sampling

premium mall only if public visibility matters too

workplace + premium hybrid if justified

If target audience = households / parents / families

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

mall/family-footfall only when public visibility is also useful

If target audience = shoppers close to purchase

Prefer:

In-Store / Retail Sampling

retail + activation hybrid

mall only if purchase-context route is weak but trial still valuable

If target audience = students / youth

Prefer:

College / Campus Sampling

youth-heavy activation

mall only if public youth relevance is stronger than campus access

If target audience = fitness / performance users

Prefer:

Gym / Fitness Sampling

gym + workplace hybrid

premium public setup only if visibility matters too

5.3 Decision Tree C — Trust-Sensitive Category Rule

Applies to

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule Path

If category is trust-sensitive:

evaluate whether environment feels credible and relevant

demote touchpoints that are operationally possible but contextually weak

prefer guided interaction when education matters

prefer pilot-first if audience/context performance is uncertain

Example

If Baby Care brief asks for broad public mall handout at scale:

do not reject immediately

but demote mall as primary unless family-footfall relevance is very strong and tone can remain controlled

promote residential or family retail alternatives first

5.4 Decision Tree D — Scale-First vs Precision-First

If category is FMCG / Snacks / Beverages

Ask:

is usage relevance broad?

is trial scale important?

are handling requirements manageable?

If yes:

recommend scale-capable environments first

If category is Beauty / Skincare, Wellness, Baby Care, Menstrual Hygiene, Pet Care

Ask:

does audience quality matter more than quantity?

does trust or education matter?

can the environment affect perception?

If yes:

recommend precision / quality-first environments first

5.5 Decision Tree E — Retail Conversion Need

If primary objective includes any of the following:

sell-out support

shopper education near purchase

store movement

pharmacy / retail conversion

Then:

promote In-Store / Retail Sampling to primary or near-primary rank

use mall / public trial only as a support layer if helpful

use awareness-led formats only as secondary support

Rule

Do not let “visibility” overpower “purchase-context need” when the client’s stated goal is sell-out or conversion support.

5.6 Decision Tree F — Pilot-First Trigger

Recommend pilot-first when any of these are true:

category is premium or trust-sensitive

the client is testing a new touchpoint

the environment fit is plausible but unproven

the product has handling or training complexity

the client wants proof before scale

multiple services look viable but not conclusively so

Output Pattern

primary recommendation

clear “pilot-first” label

phase 2 expansion path if pilot succeeds

5.7 Decision Tree G — Hybrid Recommendation Trigger

Recommend hybrid only when:

the brief includes two distinct audience clusters

the brief needs both trial and visibility

a single touchpoint solves only part of the job

the brand wants phase-wise validation across environments

Good Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid by default when one service clearly solves the main objective well enough.

6. Scenario Test Library Structure

Each scenario includes:

lead brief

industry

objective

audience

known facts

unknowns

expected primary recommendation

expected secondary recommendation

expected suppression logic

whether pilot-first should trigger

why this case matters

7. Scenario Test Library

7.1 Scenario 1 — Premium Skincare Launch for Women Professionals

Lead Brief

A premium skincare brand wants to launch a serum in Bangalore and is targeting women professionals aged 24–35. They are considering sampling, want quality audience more than mass distribution, and have moderate budget.

Classified Inputs

Industry: Beauty / Skincare

Objective: Product Trial + Premium Introduction

Audience: Women Professionals

Geography: Bangalore

Budget: moderate

Timeline: within 30 days

Expected Output

Primary: IT Park Sampling

Secondary: Mall Sampling / Mall Activation

Optional Expansion: IT Park + premium mall hybrid

Suppress: LED Van as primary

Pilot-First: Yes

Why

Audience precision is stronger than public visibility as the primary job.

7.2 Scenario 2 — Snack Brand Wants High-Volume Trial in Bangalore

Lead Brief

A snack brand wants 25,000 sample trials in Bangalore over 2 weeks. They are open to colleges, IT parks, and malls. Product is simple to distribute and there are no heavy handling constraints.

Classified Inputs

Industry: FMCG / Snacks / Beverages

Objective: Mass Trial

Audience: broad youth + office-goers

Geography: Bangalore

Budget: reasonable

Handling: simple

Expected Output

Primary: Hybrid Campaign Solution

Secondary: IT Park Sampling or College Sampling depending city mix

Optional Expansion: Mall sampling for public visibility layer

Suppress: premium-only narrow channels as sole recommendation

Pilot-First: No, unless budget/timeline uncertainty exists

Why

This is a scale-first, usage-friendly product with multiple viable high-volume environments.

7.3 Scenario 3 — Protein Beverage for Fitness Audience

Lead Brief

A wellness brand wants to push a protein hydration drink among active gym-goers in Bangalore and Hyderabad. The team wants the right users, not random scale.

Classified Inputs

Industry: Wellness / Nutrition

Objective: Trial + Affinity Audience Introduction

Audience: Fitness Users

Geography: Bangalore, Hyderabad

Priority: affinity-first

Expected Output

Primary: Gym / Fitness Sampling

Secondary: IT Park Sampling if office-going wellness crossover exists

Optional Expansion: gym + workplace hybrid

Suppress: random mall/public trial as primary

Pilot-First: Yes

Why

Credibility of context matters. Fitness relevance outranks generic high-footfall reach.

7.4 Scenario 4 — Baby Care Product for Young Parents

Lead Brief

A premium baby-care brand wants to introduce a new lotion to parents of infants and toddlers in Bangalore. They care about trust and relevance more than mass reach.

Classified Inputs

Industry: Baby Care

Objective: Trust-Building Trial

Audience: Parents of infants and toddlers

Geography: Bangalore

Priority: trust-first

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling

Optional Expansion: premium communities + retail hybrid

Suppress: college, gym, LED van as primary

Pilot-First: Yes

Why

Trust-relevant family environment should dominate the recommendation.

7.5 Scenario 5 — Menstrual Hygiene Campaign for College Students

Lead Brief

A menstrual hygiene brand wants to build awareness and trial among college-age women in Chennai and Bangalore. Education is as important as product introduction.

Classified Inputs

Industry: Menstrual Hygiene

Objective: Education + Trial

Audience: College students

Geography: Chennai, Bangalore

Tone sensitivity: high

Expected Output

Primary: College / Campus Sampling

Secondary: Kiosk-Based Education / Activation Booth

Optional Expansion: college + workplace phase 2 if brand expands audience

Suppress: LED Van as primary, generic mass public handout

Pilot-First: Yes

Why

Education and comfort fit matter more than raw broad reach.

7.6 Scenario 6 — Pet Food Trial for Premium Pet Parents

Lead Brief

A pet-food brand wants to reach dog owners in premium apartment communities in Bangalore. They do not want broad household waste.

Classified Inputs

Industry: Pet Care

Objective: Targeted Trial

Audience: Dog owners in premium communities

Geography: Bangalore

Priority: owner relevance

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling in pet retail environments

Optional Expansion: premium community + pet retail hybrid

Suppress: mall/public mass distribution as primary

Pilot-First: Yes

Why

Pet-owner density and audience precision are critical.

7.7 Scenario 7 — Beverage Launch Wants Buzz, Not Sampling

Lead Brief

A beverage brand wants city-wide launch buzz for 5 days in Bangalore and Hyderabad. They want strong visibility fast and are not focused on trial in phase 1.

Classified Inputs

Industry: FMCG / Beverages

Objective: Awareness / Launch Buzz

Audience: broad public

Geography: Bangalore, Hyderabad

Speed: high

Expected Output

Primary: LED Van / Mobile Outreach

Secondary: Mall Activation if public visibility and physical brand presence are also needed

Optional Expansion: mobile outreach + selective sampling in phase 2

Suppress: product sampling as sole phase-1 recommendation if trial is not the current job

Pilot-First: Not necessary unless city/route ambiguity is high

Why

The core job is visibility, not trial.

7.8 Scenario 8 — Skincare Brand Wants Retail Sell-Out Support

Lead Brief

A skincare brand is already in a retail chain and wants stronger trial and shopper education to improve sell-out in 20 stores.

Classified Inputs

Industry: Beauty / Skincare

Objective: Sell-Out Support

Audience: Retail shoppers near purchase

Geography: Bangalore

Retail context: strong

Expected Output

Primary: In-Store / Retail Sampling

Secondary: Kiosk-Based Demo support where useful

Optional Expansion: retail + selective mall awareness if needed later

Suppress: IT Park as primary unless secondary objective emerges

Pilot-First: Yes if store behavior is untested

Why

Purchase-context need outranks premium audience experimentation.

7.9 Scenario 9 — Ambiguous Marquee FMCG Brief

Lead Brief

A well-known FMCG brand says, “We want something impactful pan-India,” but shares no real audience, no budget, and no clear objective.

Classified Inputs

Industry: FMCG

Objective: unclear

Audience: unclear

Budget: unknown

Strategic value: high

Expected Output

Primary: No strong service recommendation yet

Secondary: none until discovery improves

Optional Expansion: not applicable yet

Suppress: premature multi-touchpoint grand solution

Pilot-First: not yet; first recommend structured discovery

Escalation: Yes, high-value but low-confidence

Why

The system must resist looking smart by inventing a solution too early.

7.10 Scenario 10 — Budget-Misaligned Premium Mall Request

Lead Brief

A new brand asks for a premium multi-city mall activation but indicates a very low budget and wants immediate execution.

Classified Inputs

Industry: unknown consumer brand

Objective: visibility + trial perhaps

Budget: weak

Timeline: aggressive

Requested touchpoint: premium mall

Expected Output

Primary: Re-scope / clarify, not direct mall confirmation

Secondary: lighter public trial or pilot recommendation if relevant

Suppress: premium mall rollout as-is

Pilot-First: Yes if the client shows flexibility

Escalation: only if strategic value is high

Why

The system must protect against unrealistic client-led touchpoint bias.

8. Negative Test Cases

These are scenarios where the system should fail safely rather than force a recommendation.

8.1 Negative Case — Too Little Information

Expected behavior:

ask next-best question

do not recommend a service confidently

do not mark proposal-ready

8.2 Negative Case — High Budget but Wrong Audience Context

Expected behavior:

demote attractive but brand-weak environments

explain why a more relevant environment is stronger

8.3 Negative Case — Client Insists on Misfit Touchpoint

Expected behavior:

acknowledge the requested touchpoint

explain limitations

suggest better alternative

do not blindly confirm requested service as primary

8.4 Negative Case — High Strategic Brand, Low Confidence

Expected behavior:

escalate

avoid overcommitting

produce structured missing-information summary

9. Scenario Evaluation Rubric

Use this rubric to judge whether the engine behaves correctly.

Suggested Pass Standard

A scenario should pass only if the system gets the primary path, suppression logic, and reasoning explanation broadly right.

10. Expected Failure Patterns to Watch

During testing, watch for these recurring failures:

recommending the client’s mentioned touchpoint too early

overvaluing scale in trust-sensitive categories

overvaluing premium environments for broad FMCG needs

recommending hybrid campaigns too often

recommending LED/mobile formats when the true job is trial or education

weak suppression of misfit services

false proposal-readiness despite major unknowns

11. Suggested Testing Cadence

Round 1: Founder Calibration

run 10 scenarios manually with founder review

compare system recommendation vs founder recommendation

Round 2: Sales Calibration

run 10–15 real historical leads

compare recommendation usefulness for sales users

Round 3: Ops Calibration

test feasibility-sensitive scenarios

check whether the system under-warns or over-warns

Round 4: Pilot Live Monitoring

log real-world scenarios where recommendation changed after human review

turn those into new test cases

12. Suggested Scenario JSON Format

```
{
"scenario_id": "SCN-001",
"industry": "Beauty / Skincare",
"objective": "Product Trial",
"target_audience": "Women Professionals",
"geography": ["Bangalore"],
"known_facts": [
"premium product",
"moderate budget",
"working women"
],
"expected_primary_recommendation": "IT Park Sampling",
"expected_secondary_recommendation": "Mall Sampling / Mall Activation",
"expected_suppressed_services": [
"LED Van / Mobile Outreach"
],
"pilot_first_expected": true
```

}

13. Validation Checklist

14. Publication Readiness Checklist — Pending Actions

Before this decision-tree and scenario library goes live, AIM should complete the following:

founder review of all major scenario expectations

sales-head review of recommendation usefulness across real examples

ops review for feasibility-sensitive cases

addition of 15–20 real AIM historical lead scenarios

mapping of each scenario to service-record and industry-playbook IDs

creation of pass/fail evaluation sheet for QA and pilot reviews

15. Recommended Immediate Next Artifact

After this decision-tree and scenario test library, the next strongest artifact is:

Founder Calibration Workbook + Historical Lead Test Set

Reason:

the rules are now defined

the next step is to validate them against AIM's actual founder judgment and past leads

this is the fastest way to catch wrong defaults before build hardening

AIM Product Sampling (Core) — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for Product Sampling (Core) from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas so that:

the main document remains lighter and safer to manage

the Product Sampling pack can be reviewed, validated, and iterated independently

AIM can use this as the working parent service record for ingestion

This is the parent service record for Product Sampling. Child services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

2. Service Record Header

3. Service Definition

Working Definition

Product Sampling is AIM's controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

4. Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following:

product trial

awareness through physical experience

new product launch support

target-group-specific introduction

category education

sell-out assistance in supported environments

feedback collection after trial

trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

5. Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

6. Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

7. Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

8. Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

9. Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known:

product category

target audience

geography

timeline band

sample volume or scale band

preferred touchpoint or touchpoint recommendation path

campaign model (pilot / rollout)

budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

10. Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following:

permission dependency by chosen touchpoint

product handling requirements

temperature / tasting / demo constraints if any

timeline realism

promoter/staffing need

branding/setup scope if applicable

city-level ops availability

reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

11. Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by:

touchpoint type

city and geography spread

sample volume

campaign duration

promoter/manpower need

setup / kiosk / branding requirement

permissions dependency

reporting complexity

handling complexity of sample product

campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

12. Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

13. Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

14. Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say:

“Product Sampling is a strong parent fit.”

then recommend child path(s) with reason

then show assumptions and missing inputs before final scoping

15. Risk Flags

The system should explicitly warn when:

product category and venue appear mismatched

target audience is too broad for current scope

timeline may not support permissions or setup

scale is too low for chosen touchpoint economics

attribution expectations exceed planned campaign design

sample handling requirements are still unclear

16. Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by:

industry

objective

touchpoint

geography

audience type

scale band

reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

17. Service Record JSON Shape (Suggested)

```
{
"service_name": "Product Sampling",
"service_code": "AIM-SVC-PS-001",
"service_type": "parent",

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of objections and discovery questions

ops validation of feasibility risks and handling constraints

case-study mapping for at least 3 strong parent references

confirmation of child-service inheritance model in knowledge schema

approval of parent scoring cues and escalation triggers

20. Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is:

IT Park Sampling

Reason:

it is one of AIM’s highest-value sampling variants

it frequently needs nuanced founder judgment

it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM’s targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Entity Brain — Product Requirements Document (PRD)

1. Document Summary

Product Name: AIM Entity Brain

Prepared For: AIM Leadership, Sales, Ops, Product, Engineering

Primary Goal: Convert founder-level commercial knowledge into a structured, scalable intelligence system that can qualify leads, guide discovery, recommend solutions, score opportunities, and sync clean intelligence into CRM.

2. Problem Statement

AIM’s best commercial judgment currently lives in the founders’ heads.

This creates recurring gaps: - Sales team depends too heavily on founders for requirement understanding and solution mapping. - Leads often come in with incomplete information, making proposal creation difficult or slow. - Discovery quality varies by salesperson. - Follow-up questions are sometimes repetitive, irrelevant, or not commercially useful. - CRM records are incomplete and inconsistent. - High-intent leads are not always identified early enough. - AI automation for chat or calling cannot work well without a strong company intelligence layer.

The business needs a system that can think more like a founder during lead intake and discovery.

3. Product Vision

AIM Entity Brain will be the company’s commercial reasoning layer.

It will: - understand services, sub-services, industries, deliverables, timelines, pricing logic, constraints, and case studies - ask the right next question based on context - avoid repetitive or low-value questioning - map lead requirements to solution pathways - score leads using AIM-specific commercial logic - assign the right salesperson or escalate for founder review - generate structured summaries and CRM-ready data - continuously improve from win/loss and

human override feedback

This is not just a chatbot. It is a decision engine with memory, workflow, and learning.

4. Product Objectives

Primary Objectives

Improve discovery quality across all inbound leads.

Reduce founder dependency during lead qualification and solutioning.

Increase speed from inquiry to proposal readiness.

Improve CRM data quality and structured lead intelligence.

Create a reusable intelligence layer for sales copilot, chatbot, and AI telecalling.

Secondary Objectives

Improve lead routing and prioritization.

Reduce wasted effort on low-fit leads.

Standardize early-stage requirement gathering.

Improve consistency of proposal inputs.

Build long-term institutional memory.

5. Users

Primary Users

Sales Executives

Senior Sales Team

Sales Head

Founders

Business Development Team

Secondary Users

Operations team

Proposal team

CRM admins

Product and engineering team

External Users (Later Phase)

Website visitors

WhatsApp inquiry prospects

Outbound call recipients

6. User Problems to Solve

Sales Team Problems

“I do not know what to ask next.”

“I do not know if I have enough information to quote.”

“I do not know which service combination to pitch.”

“I need founder support for every nuanced inquiry.”

Founder Problems

“Sales keeps asking the same kind of questions.”

“Leads reach me with incomplete briefs.”

“Proposals are delayed because discovery was weak.”

“Commercial thinking is not standardized.”

Operations Problems

“Sales overpromises without checking feasibility.”

“Requirements are incomplete or vague during handoff.”

CRM Problems

“Lead records are incomplete.”

“Important commercial fields are unstructured.”

“Scoring and routing are inconsistent.”

7. Scope Definition

In Scope (Phase 1–3)

Service intelligence

Industry intelligence

Discovery question engine

Lead scoring engine

Solution recommendation engine

CRM field mapping

Internal sales copilot

External discovery chatbot

Case study retrieval

Proposal readiness assessment

Human override and feedback capture

Out of Scope (Initial Phase)

Fully autonomous proposal generation with final pricing approval

Fully autonomous discounting

End-to-end unattended telecalling at scale

Contract drafting automation

Final execution planning without human review

8. Core Product Principles

Ask only what changes the commercial decision.

Do not repeat what is already known.

Separate confirmed facts from inferred facts.

Do not promise beyond approved service logic.

When confidence is low, escalate to human review.

Every interaction should improve future intelligence.

9. Product Modules

9.1 Service Intelligence Engine

This module stores AIM’s service structure.

It should know: - service categories - sub-services - fit conditions - misfit conditions - ideal industries - ideal use cases - pricing bands - typical lead time - deliverables - exclusions - dependencies - risks - add-ons - reporting capabilities

Example Output

For a product sampling inquiry, the module should identify whether the use case is better suited for: - IT park sampling - mall activation - RWA sampling - in-store retail sampling - gym activation - quick commerce integration - multi-touchpoint pilot

9.2 Industry Intelligence Engine

This module stores how industries behave commercially.

It should know: - industry goals - buyer personas - decision cycles - budget behavior - common objections - relevant pitch angles - preferred channels/touchpoints - compliance or sensitivity issues - seasonality

Example

Skincare launches may require: - women-focused TG segmentation - premium environment fit - trial plus feedback mechanism - attribution discussion if D2C or marketplace-linked

9.3 Discovery Engine

This is the questioning brain.

It should: - identify critical missing information - select the next-best question - avoid duplicate questions - skip irrelevant questions - understand when enough information exists for the next stage - classify answers into structured CRM fields

Discovery Logic Rules

Each question should be tagged by: - service relevance - industry relevance - commercial purpose - mandatory for quote? - mandatory for feasibility? - mandatory for scoring? - ask-if conditions - skip-if conditions

Output Types

confirmed field update

inferred field update

missing information list

next-best question

9.4 Solution Mapper

This module translates discovery into recommended commercial solutions.

It should answer: - what service or sub-service fits best? - what touchpoint mix is appropriate? - should we propose pilot or full rollout? - what budget band is likely? - what timeline is realistic? - which case studies are relevant? - what risks should be flagged?

Example

If the lead is a beauty brand targeting working women in Bangalore with moderate budget and short timeline, the system may recommend: - IT parks + premium malls as primary mix - phase 1 pilot before scale - feedback capture + QR-based redemption - case studies from beauty/personal care category

9.5 FitScore Engine

This module calculates opportunity quality.

Score Components

Fit Score — 25

Authority Score — 15

Urgency Score — 15

Budget Score — 15

Completeness Score — 10

Strategic Value Score — 10

Feasibility Score — 10

Score Output Bands

80–100: High-priority qualified lead

60–79: Good lead, standard follow-up

40–59: Needs more information or nurture

Below 40: Low-fit or low-priority lead

Uses of Score

routing

SLA priority

founder escalation

proposal urgency

nurture vs immediate pursuit

9.6 Proposal Readiness Engine

This module checks whether enough information exists to move to proposal.

It should determine:

ready for capability deck only

ready for budgetary estimate

ready for scoped proposal

not ready; more discovery needed

It should also generate:

discovery summary

missing commercial inputs

suggested proposal modules

suggested case studies

suggested next action

9.7 CRM Intelligence Sync

This module converts conversation into structured CRM records.

It should update:

lead basic profile

service and sub-service

industry

objective

budget band

timeline

authority level

target audience

geography

completeness score

total lead score

recommended owner

recommended next step

missing information

It should also trigger:

task creation

SLA tagging

owner assignment

escalation to sales head/founder if required

9.8 Sales Copilot

This is the first interface to launch.

Primary Capabilities

show current lead understanding

show missing fields

suggest next questions during live call/chat

recommend service path

show lead score

show risks and assumptions

suggest case studies and pitch angle

indicate proposal readiness

Success Outcome

A salesperson should be able to handle a nuanced discovery conversation with much less founder intervention.

9.9 Discovery Chatbot

This is the second interface to launch.

Channels

website

WhatsApp

chat widget

Primary Capabilities

welcome and classify inquiry

ask context-aware questions

avoid repetitive questions

gather structured requirement data

create CRM lead

summarize requirements before handoff

hand over to human with clean context

Design Principle

The experience should feel like a smart pre-consultation, not a long lead form.

9.10 Voice Prospecting Engine (Later Phase)

This is the third interface to launch.

Uses

cold outreach

qualification calls

callback handling

early intent screening

It should use the same brain for:

pitch selection

objection handling

qualification logic

next-step routing

Strong Controls Needed

human escalation rules

no unsupported claims

no unapproved commercial commitments

call review and audit trail

10. Core Data Model

Key Objects

Service Master

Sub-Service Master

Industry Playbook

Discovery Question Bank

Solution Rules

Lead Profile

Lead Answers

Case Study Library

Objection Library

Proposal Modules

Feedback Events

Version Log

Field Status Types

Each commercially important field should have a status: - Confirmed - Inferred - Missing - Not Applicable

This is important so the system never confuses assumptions with actual customer-provided facts.

11. CRM Field Definitions

Lead Identity

12. Key User Flows

12.1 Inbound Lead via Website / WhatsApp

User starts inquiry.

System classifies probable service and industry.

Relevant discovery logic loads.

Bot asks next-best question.

Structured fields are populated.

Lead score updates in real time.

Proposal readiness is evaluated.

CRM record is created/updated.

Salesperson is assigned.

Discovery summary is pushed to assigned owner.

12.2 Salesperson-Assisted Discovery

Salesperson opens lead.

Copilot shows known data and missing commercial fields.

Copilot suggests next-best questions.

Salesperson captures answers.

Engine updates score and recommendations.

Proposal readiness is checked.

Next action is recommended.

12.3 Founder Review Escalation

Lead has high strategic value or low confidence.

System flags for founder review.

Founder sees summarized context, missing information, and system recommendation.

Founder accepts, edits, or overrides.

Override is stored as learning input.

13. Screens / Interface Requirements

13.1 Lead Intelligence Dashboard

Must show: - lead overview - service classification - key requirement fields - score breakdown - confidence level - missing information - suggested next questions - recommended owner - proposal readiness

13.2 Discovery Panel

Must show: - live transcript or answer stream - questions already asked - fields already collected - next-best question suggestions - skipped questions and reason

13.3 Solution Recommendation Panel

Must show: - recommended service mix - why it is recommended - alternative options - likely budget band - timeline band - case studies - risks

13.4 Founder Review Panel

Must show: - summary - score - assumptions - missing information - escalation reason - approve / modify / override actions

13.5 Admin Knowledge Management Panel

Must allow: - add/edit services - add/edit question bank - update scoring logic - tag case studies - version control - activate/deactivate outdated logic

14. Functional Requirements

Must Have

structured service and industry knowledge storage

context-aware questioning

field-level state tracking

CRM field mapping

lead scoring

assignment logic

proposal readiness detection

human override capture

case study retrieval

audit logs

Should Have

objection handling suggestions

pitch-angle recommendation

email/WhatsApp summary generation

founder override analytics

win/loss learning dashboards

Later

AI voice calling

automated meeting scheduling

auto-generated tailored proposal drafts

predictive win probability

15. Non-Functional Requirements

fast enough for live salesperson use during calls

support multi-turn stateful conversations

secure access control by role

full auditability of question/answer flow

version control for service logic

scalable across multiple services and future brands

reliable CRM sync

fallback behavior if model confidence is low

16. Guardrails and Governance

Commercial Guardrails

no final price commitment without approved logic

no unsupported delivery promise

no unauthorized discounts

no invented case studies or results

Reasoning Guardrails

always distinguish confirmed vs inferred data

ask only relevant questions

never repeat confirmed questions

stop when enough information is available

escalate when confidence falls below threshold

Operational Guardrails

all high-value leads with low confidence require review

all overrides should be logged

all service definitions and question logic must be versioned

17. Analytics and Success Metrics

Sales Productivity Metrics

founder interruptions per lead

average discovery completeness score

average time to proposal readiness

average time from inquiry to first qualified summary

Lead Quality Metrics

qualified lead rate

high-score lead conversion rate

disqualification accuracy

proposal-to-win ratio

Bot Quality Metrics

duplicate question rate

irrelevant question rate

missing-field rate after discovery

confidence/escalation rate

structured field accuracy

Learning Metrics

number of founder overrides

override categories

recommendation accuracy over time

score accuracy vs actual sales outcomes

18. Phased Rollout Plan

Phase 1 — Knowledge and Logic Foundation

Deliverables

service taxonomy

sub-service taxonomy

industry playbooks

discovery question bank

lead scoring model

CRM field map

case study library tagging

founder override workflow

Goal

Create the structured commercial brain.

Phase 2 — Internal Sales Copilot

Deliverables

lead intelligence dashboard

live discovery assistant

CRM sync

score and routing engine

proposal readiness engine

Goal

Improve internal discovery and reduce founder dependence.

Phase 3 — External Discovery Bot

Deliverables

website/WhatsApp bot

stateful questioning

automatic lead structuring

human handoff summary

Goal

Qualify inbound leads consistently before sales handoff.

Phase 4 — Voice Prospecting Engine

Deliverables

AI outbound calling

transcript intelligence

callback routing

objection capture

review dashboard

Goal

Scale prospecting using the same entity brain.

19. Risks

Risk 1: Overloading with raw documents

Mitigation: normalize critical knowledge into structured entities.

Risk 2: Weak discovery logic

Mitigation: start with founder-reviewed question banks and override loops.

Risk 3: Overpromising by AI

Mitigation: strong commercial guardrails and required confidence thresholds.

Risk 4: Low user adoption by sales team

Mitigation: design for live call usability and measurable productivity benefits.

Risk 5: Incorrect scoring early on

Mitigation: tune scoring model with real lead outcomes and founder reviews.

20. MVP Definition

MVP Includes

core services and sub-services

top target industries

60–100 curated discovery questions

service recommendation logic

scoring engine

CRM writeback

internal sales copilot

founder review/override capture

MVP Excludes

public chatbot at launch

voice calling at launch

autonomous final pricing

autonomous proposal issuance

21. Launch Recommendation

Launch order should be: 1. Knowledge Core 2. Sales Copilot 3. CRM Intelligence Sync 4. External Discovery Bot 5. Voice Prospecting Engine

This sequence gives the fastest ROI and the safest learning loop.

22. Final Recommendation

AIM should build this first as an internal commercial intelligence and discovery copilot, not as a public chatbot.

Reason: - internal copilot creates immediate value - improves lead quality and CRM quality - generates training data - validates discovery logic safely - reduces founder dependency before customer-facing automation

Once internal discovery is strong, the same brain can power inbound chatbot and outbound AI calling with much higher accuracy and much lower risk.

23. Next Document to Create

After this PRD, the recommended next documents are: 1. Functional specification by module 2. CRM field mapping sheet 3. Knowledge model / ontology document 4. User stories and acceptance criteria 5. API and integration specification 6. Wireframes for dashboard and copilot screens 7. Rollout plan with owners and milestones

24. Module-wise Functional Specification

24.1 Module: Knowledge Core

Purpose

Store and manage AIM’s structured commercial intelligence.

Inputs

service definitions

sub-service definitions

industry playbooks

discovery questions

pricing bands

case studies

objections

proposal modules

execution constraints

version changes

Core Functions

create and maintain service records

create and maintain industry records

manage question bank with conditions

manage solution rules

manage case study tagging

manage version history

activate/deactivate outdated logic

Outputs

structured knowledge objects for orchestration engine

searchable case studies and commercial assets

version-controlled service logic

Business Rules

every active service must have at least one discovery path

every service must define mandatory inputs for quote and feasibility

every question must be mapped to a field or decision purpose

outdated logic must not be used in live workflows once deactivated

Dependencies

admin panel

database

retrieval store

access control

Admin Actions

add service

edit service

archive service

add industry playbook

edit questions

adjust scoring logic references

upload case study assets

24.2 Module: Discovery Engine

Purpose

Run context-aware questioning and field-state tracking.

Inputs

current lead state

known fields

missing fields

service context

industry context

prior questions asked

confidence signals

Core Functions

classify inquiry

identify critical unknowns

select next-best question

avoid duplicate questioning

mark fields as confirmed/inferred/missing/not applicable

determine if enough information exists to proceed

Outputs

next-best question

updated field state

missing information list

discovery summary

proposal readiness signal

Business Rules

do not ask a question if field is already confirmed unless clarification is required

ask only questions relevant to current service and stage

stop discovery when minimum information threshold is reached for next step

low-confidence inference must be marked as inferred, not confirmed

Dependencies

knowledge core

orchestration engine

CRM field map

conversation layer

24.3 Module: Solution Mapper

Purpose

Translate discovered requirements into commercially relevant solution paths.

Inputs

service classification

industry classification

discovered lead attributes

solution rules

case studies

pricing references

feasibility notes

Core Functions

recommend service and sub-service mix

recommend touchpoint mix

suggest pilot vs full rollout

estimate budget band

estimate timeline band

identify relevant case studies

highlight delivery risks and dependencies

Outputs

recommended solution path

alternative options

budget band suggestion

timeline guidance

case study shortlist

risk flags

Business Rules

no final pricing commitment without approved pricing logic

if feasibility is unclear, flag human review

solution recommendations must reference only active services

24.4 Module: FitScore Engine

Purpose

Score the lead according to AIM-specific commercial logic.

Inputs

authority data

fit data

budget data

urgency data

completeness state

feasibility state

strategic value indicators

Core Functions

calculate component scores

calculate total score

assign lead band

recommend SLA level

recommend escalation path

Outputs

score breakdown

total score

confidence score

routing recommendation

Business Rules

missing critical fields should reduce completeness and confidence

high strategic value can increase priority but should not hide feasibility issues

leads above configured threshold should trigger faster assignment

24.5 Module: CRM Intelligence Sync

Purpose

Map structured lead intelligence into CRM and trigger workflow.

Inputs

lead identity data

discovered commercial fields

scores

recommendations

ownership logic

Core Functions

create new lead

update existing lead

write structured fields

create tasks

assign owner

tag SLA priority

attach discovery summary

log recommendations and missing data

Outputs

CRM record

owner assignment

task queue entries

activity log

Business Rules

required lead fields must be validated before CRM sync

existing leads should be updated, not duplicated, where match confidence is sufficient

every CRM write must be auditable

24.6 Module: Sales Copilot

Purpose

Support salespeople in live discovery, qualification, and next-step planning.

Inputs

CRM lead state

discovery engine output

score output

solution recommendations

Core Functions

display lead understanding

display missing fields

suggest next questions live

show recommended pitch angle

show case studies and risks

show proposal readiness

Outputs

salesperson guidance

improved discovery quality

faster handoff to proposal stage

Business Rules

salesperson must be able to override system suggestions

overrides must be logged with reason if they change major fields or recommendations

24.7 Module: Discovery Chatbot

Purpose

Run external prospect qualification in a structured but conversational way.

Inputs

prospect messages

channel context

discovery logic

known company/contact data

Core Functions

greet and classify inquiry

ask next-best question

maintain state across turns

summarize requirement

sync to CRM

hand off to human when appropriate

Outputs

structured lead brief

handoff summary

live lead score

Business Rules

no repetitive questions

do not request unnecessary information

escalate when prospect asks for commitments outside approved scope

preserve context across channel turns where technically possible

24.8 Module: Founder Review & Override

Purpose

Allow high-value or low-confidence leads to be reviewed and corrected by founder/sales head.

Inputs

lead summary

score

confidence status

escalation reason

system recommendation

Core Functions

show escalation context

allow approval/edit/override

log override reason

write override back into system

feed override into learning loop

Outputs

final approved direction

learning signal

updated CRM and recommendation state

Business Rules

all overrides must be logged

override should distinguish between pricing correction, service correction, discovery correction, or routing correction

24.9 Module: Learning & Evaluation Layer

Purpose

Improve the brain over time through outcomes and review.

Inputs

lead outcomes

win/loss reasons

override logs

question quality ratings

recommendation accuracy reviews

Core Functions

track performance by module

identify failure patterns

identify weak questions

identify weak scoring rules

support review cycles

suggest updates to knowledge logic

Outputs

evaluation dashboards

quality reports

update recommendations

Business Rules

only approved logic updates should affect production behavior

historical outcomes should remain linked to the version used at the time

25. User Stories

25.1 Sales Executive

As a sales executive, I want to see the missing information for a lead so that I know what to ask next.

As a sales executive, I want the system to suggest relevant questions during a call so that I can conduct better discovery.

As a sales executive, I want to know whether the lead is ready for proposal so that I do not waste time preparing incomplete quotes.

As a sales executive, I want the system to suggest the right service mix so that I can pitch confidently.

As a sales executive, I want case study recommendations relevant to the lead so that I can strengthen my conversation.

25.2 Sales Head

As a sales head, I want high-intent leads to be prioritized automatically so that the team focuses on the right opportunities.

As a sales head, I want low-confidence but high-value leads to be escalated so that important opportunities are not mishandled.

As a sales head, I want to review scoring logic and override patterns so that I can improve sales quality.

25.3 Founder

As a founder, I want the system to capture my commercial reasoning in structured form so that the company can scale beyond founder dependency.

As a founder, I want to review escalated leads with complete context so that I can intervene quickly and effectively.

As a founder, I want overrides to improve the system so that repeated corrections reduce over time.

25.4 Operations Manager

As an operations manager, I want the sales handoff to include clear deliverables, assumptions, and risks so that execution planning is accurate.

As an operations manager, I want feasibility-sensitive leads to be flagged early so that sales does not overpromise.

25.5 CRM Admin

As a CRM admin, I want structured field mapping from conversations so that lead records remain clean and useful.

As a CRM admin, I want duplicate lead checks before sync so that the CRM stays reliable.

25.6 External Prospect

As a prospect, I want the chatbot to ask relevant questions without repetition so that the experience feels intelligent and professional.

As a prospect, I want the system to understand my requirement before transferring me to a salesperson so that I do not have to repeat myself.

26. Acceptance Criteria

26.1 Knowledge Core

Admin can create, edit, archive, and version services.

Admin can attach mandatory discovery fields to each active service.

Admin can map each question to a field or decision purpose.

Archived service logic is not used in new live recommendations.

26.2 Discovery Engine

System does not ask a field-confirming question again unless clarification is needed.

System selects questions based on service, industry, stage, and missing critical fields.

System marks each important field as confirmed, inferred, missing, or not applicable.

System can indicate when sufficient information exists for the next stage.

26.3 Solution Mapper

System provides at least one recommended solution path when minimum discovery threshold is met.

System includes risk flags when feasibility-related data is weak or missing.

System does not generate solution recommendations using inactive services.

26.4 FitScore Engine

System calculates and stores component-wise score breakdown.

System assigns lead band based on configured thresholds.

System recalculates score when critical new answers are added.

26.5 CRM Intelligence Sync

System can create a new lead with required structured fields.

System can update an existing lead without creating duplicates where match logic is satisfied.

Every CRM write action is logged with timestamp and source.

26.6 Sales Copilot

Sales user can see known fields, missing fields, score, and next-best questions in one view.

Sales user can submit an override to system suggestions.

Override reason is stored for review when major changes are made.

26.7 Discovery Chatbot

Bot can maintain context across at least one multi-turn discovery flow.

Bot avoids duplicate questions within the same conversation.

Bot can produce a structured lead summary before human handoff.

Bot can hand off to human when low confidence or out-of-scope request is detected.

26.8 Founder Review

Escalated lead shows score, confidence, summary, risks, and recommendation in one place.

Founder can approve, edit, or override system recommendation.

Override is recorded and sent to learning layer.

26.9 Learning Layer

System stores lead outcome and override events.

System can report question quality and recommendation accuracy trends.

Logic updates require approval before being activated in production.

27. Screen-wise Requirements

27.1 Screen: Lead Intelligence Dashboard

Must Display

lead profile header

company/contact details

source channel

service classification

score breakdown

confidence indicator

proposal readiness status

missing information list

recommended next action

Actions

open discovery panel

assign owner

escalate for review

sync/update CRM

open related case studies

27.2 Screen: Live Discovery Assistant

Must Display

current conversation transcript or notes

questions already asked

next-best question suggestions

field status tracker

answer capture inputs

Actions

mark answer as confirmed

edit inferred values

skip question with reason

request founder review

27.3 Screen: Solution Recommendation Panel

Must Display

recommended service mix

recommended touchpoints

estimated budget band

estimated timeline band

case study suggestions

assumptions

risks and exclusions

Actions

accept recommendation

choose alternative recommendation

send to proposal stage

escalate

27.4 Screen: Founder Review Panel

Must Display

escalation reason

system summary

system score

confidence status

recommendation

override history if any

Actions

approve

edit fields

override recommendation

change owner

send feedback to system

27.5 Screen: Knowledge Admin Panel

Must Display

list of services

list of industries

list of question banks

version history

active/inactive status

Actions

add/edit/archive entries

change question conditions

upload case studies

publish new version

28. Workflow State Definitions

SOPs

30. Release Plan by Sprint Theme

Sprint Theme 1

finalize data model

finalize service taxonomy

finalize question bank framework

Sprint Theme 2

build knowledge admin layer

build service and industry records

build field-state model

Sprint Theme 3

build discovery engine logic

build next-best question selector

build scoring engine

Sprint Theme 4

build lead intelligence dashboard

build sales copilot interface

build CRM sync

Sprint Theme 5

founder review workflow

override logging

evaluation dashboard basics

Sprint Theme 6

external discovery bot beta

handoff summary generation

pilot testing with selected inbound channels

31. Recommended Next Deliverables

The next documents to create after this functional specification are: 1. Detailed CRM field mapping sheet 2. Service taxonomy sheet 3. Discovery question matrix by service and industry 4. Scoring model configuration sheet 5. Wireframes for dashboard, copilot, and founder review screens 6. API contract and event schema 7. Pilot rollout plan with ownership and milestones

32. Detailed CRM Field Mapping Sheet

This section defines the recommended CRM field structure for AIM Entity Brain.

The objective is to ensure that every discovery conversation produces: - clean structured CRM data - commercially useful lead records - reliable routing and prioritization - proposal-readiness visibility - auditability of inferred vs confirmed information

Field Design Principles

Every critical commercial field must have a clear source.

Important fields should distinguish between confirmed and inferred values.

Fields should support both human entry and AI-generated updates.

CRM fields must support downstream actions such as assignment, SLA, proposal preparation, and escalation.

Free-text notes should not replace structured fields for core qualification data.

32.1 Lead Identity Fields

32.2 Company Intelligence Fields

32.3 Contact Authority Fields

Recommended Decision Maker Status Values

Final Decision Maker

Strong Influencer

Evaluator / Researcher

Procurement Only

Agency Intermediary

Unknown

32.4 Requirement Classification Fields

Recommended Inquiry Type Values

New Requirement

Repeat Requirement

Capability Check

Budgetary Exploration

Proposal Follow-up

Partnership Inquiry

Vendor Registration

32.5 Timeline and Volume Fields

Recommended Timeline Urgency Values

Immediate (0–7 days)

Within 30 Days

Within Quarter

Exploratory / No Fixed Timeline

32.6 Budget and Commercial Fields

Recommended Budget Band Values

Below 1L

1L–3L

3L–10L

10L–25L

25L+

Unknown

32.7 Qualification and Discovery Fields

Recommended Proposal Readiness Values

Not Ready

Ready for Capability Deck

Ready for Budgetary Estimate

Ready for Scoped Proposal

Needs Human Review

32.8 Scoring Fields

Recommended Lead Priority Bands

High Intent Priority

Qualified Priority

Nurture / Clarify

Low Priority

Disqualify

32.9 Routing and Ownership Fields

Recommended Next Action Values

Schedule Discovery Call

Send Capability Deck

Send Budgetary Estimate

Prepare Proposal

Founder Review

Nurture

Disqualify

32.10 Solution Recommendation Fields

32.11 Channel Conversation Fields

32.12 Audit and Learning Fields

32.13 Required Minimum Field Set by Stage

Stage: New Lead

Required minimum: - lead_id - company_name or phone/email - source_channel - lead_origin_type - first_contact_timestamp

Stage: Discovery In Progress

Required minimum: - service_category - industry_primary - requirement_summary - discovery_stage - requirement_completeness_score - next_best_question

Stage: Qualified / Assigned

Required minimum: - total_lead_score - lead_priority_band - recommended_owner_team - SLA_priority - proposal_readiness_status - missing_information_summary

Stage: Proposal Ready

Required minimum: - service_category - sub_service_category (if known) - campaign_objective_primary - target_geography - timeline_urgency_band - budget_band - proposal_readiness_status - assumptions - risk_flags

32.14 Field Source Hierarchy

When multiple sources provide values, use this order unless manually overridden: 1. Human-confirmed user input 2. Founder / sales head override 3. Salesperson confirmed entry 4. Reliable system enrichment 5. AI inference

Rule

If AI inference conflicts with human-confirmed data, human-confirmed data wins.

32.15 Recommended CRM Object Structure

Lead Object

Stores primary lead identity and qualification state.

Account Object

Stores company-level long-term information.

Contact Object

Stores contact-level person details.

Opportunity Object

Created when lead reaches commercial seriousness threshold.

Activity Object

Stores calls, chats, emails, tasks, and follow-up actions.

Intelligence Snapshot Object

Stores AI-generated summary, scores, recommendation, assumptions, and confidence state for each major interaction cycle.

32.16 Recommended System Events

lead.created

lead.updated

discovery.started

discovery.answer.captured

discovery.completed

score.updated

owner.assigned

escalation.triggered

proposal.readiness.changed

founder.override.created

outcome.recorded

These events will help product and engineering maintain auditability and workflow automation.

32.17 Implementation Notes

Use structured enums wherever possible for routing-critical fields.

Keep requirement_summary, missing_information_summary, assumptions, and risk_flags as generated long-text fields, but do not depend only on them.

Preserve all major AI writes with timestamps and version metadata.

Keep score components stored separately, not just the total score.

Ensure duplicate detection uses phone, email, company, and source-side identifiers where available.

Make proposal_readiness_status and quote_readiness_status separate fields.

Every field updated by AI should carry a traceable source or origin in the data_origin_map.

32.18 Recommended Next Document

After this CRM mapping sheet, the next most important document is: Service Taxonomy + Discovery Question Matrix by Service and Industry

That will define exactly what AIM sells, where it fits, and what the system must ask before recommending or quoting.

33. Service Taxonomy Sheet

This section defines the recommended AIM service taxonomy for the first production version of the Entity Brain.

The purpose of this taxonomy is to ensure that the system can: - classify inquiries correctly - understand service fit and misfit - know what information is required before quoting - know what information is required before feasibility confirmation - map requirements into the correct commercial path

Taxonomy Design Principles

Start with a limited number of commercially meaningful service categories.

Separate service categories from touchpoints.

Distinguish quote inputs from feasibility inputs.

Define misfit cases clearly so the system knows when not to push a service.

Ensure each active service has at least one discovery path and one proposal path.

33.1 AIM Core Service Categories

Level 1 Categories

Product Sampling

On-Ground Brand Activation

Retail / In-Store Branding

Transit / Mobile Outreach

Residential Community Outreach

Corporate / Workplace Outreach

College / Youth Outreach

Fitness / Lifestyle Outreach

Mall / Public Venue Activation

Hybrid Campaign Solutions

Notes

Some categories are solution categories.

Some are execution environment categories.

For the Entity Brain, this is acceptable as long as the system clearly maps service logic and touchpoint logic separately.

33.2 Service Taxonomy Table

33.3 Detailed Service Definitions

33.3.1 Product Sampling

Description

AIM executes controlled product trial campaigns across selected touchpoints to drive awareness, trial, and in some cases conversion or attribution.

Primary Use Cases

product launches

new market entry

consumer trial

sell-out support

brand awareness with sampling

trial-to-conversion campaigns

Typical Industries

FMCG

beauty and skincare

personal care

wellness and nutrition

beverages and food

baby care

pet care

menstrual hygiene

Core Deliverables

touchpoint planning

promoter deployment

sample distribution

interaction or engagement execution

reporting and proof of execution

optional feedback capture

optional redemption or conversion-linked mechanism

Mandatory Quote Inputs

product category

city/cities

target audience

planned scale or sample volume

desired timeline

preferred touchpoints

Mandatory Feasibility Inputs

permission dependency

sample handling/storage constraints

staff requirement

venue access model

activation hours or timing restrictions

Common Risks

unclear target audience

unrealistic timeline

mismatch between brand and touchpoint

insufficient permissions lead time

no clarity on sample volume

33.3.2 On-Ground Brand Activation

Description

AIM creates interactive brand experiences to drive engagement, education, recall, and trial.

Primary Use Cases

new launches

experiential engagement

product demonstration

lead generation in physical environments

recall campaigns

Typical Industries

consumer brands

personal care

wellness

FMCG

electronics and appliance retail tie-ins

Mandatory Quote Inputs

venue type

activation objective

duration

branding scope

promoter/staffing expectation

Mandatory Feasibility Inputs

space availability

fabrication requirements

venue permissions

power or display requirements

safety or compliance restrictions

33.3.3 Retail / In-Store Branding

Description

AIM executes store-level visual branding and shopper visibility solutions.

Primary Use Cases

retail launch visibility

store branding rollout

shelf impact improvement

shopper conversion support

Mandatory Quote Inputs

store count

city/cities

element types required

quantity per store

execution timeline

Mandatory Feasibility Inputs

store measurement availability

retailer approvals

material specifications

installation windows

access conditions

33.3.4 Transit / Mobile Outreach

Description

AIM executes route-based, vehicle-based, or transit-facing brand visibility campaigns.

Primary Use Cases

awareness campaigns

launch buzz

route-based reach

hyperlocal visibility

Mandatory Quote Inputs

city

vehicle type

duration

quantity

date range

Mandatory Feasibility Inputs

inventory availability

local permissions

route constraints

branding production lead time

33.3.5 Hybrid Campaign Solutions

Description

AIM combines multiple touchpoints under one campaign objective for broader relevance and reach.

Primary Use Cases

multi-audience launch

pilot + scale rollout

integrated visibility + trial campaign

category education across multiple environments

Mandatory Quote Inputs

campaign objective

target segments

geography

budget band

timeline

Mandatory Feasibility Inputs

cross-touchpoint ops readiness

permissions dependency map

staffing availability

reporting framework needs

33.4 Industry Fit Notes

33.5 Service Misfit Logic

The Entity Brain should explicitly disqualify or deprioritize opportunities when any of the below are true: - the requested touchpoint does not match the target audience - the lead wants a firm quote without minimum commercial information - timeline is too short relative to permission and ops dependencies - product category is incompatible with venue or audience - stated budget is far below realistic threshold and client shows no flexibility - client expectation depends on outcomes not reasonably controllable by the service - there is no viable permission or access route

34. Discovery Question Matrix by Service and Industry

This matrix defines what the Entity Brain should ask before recommending, scoring, routing, or quoting.

Matrix Design Principles

Questions must have a purpose.

Questions must map to a field or decision.

The system should distinguish must-ask from nice-to-have.

The system should know which question affects quote, feasibility, score, or case-study selection.

The system should not ask the same question in multiple ways unless clarification is needed.

Question Type Tags

Must Ask = essential for qualification or solutioning

Quote Critical = required before meaningful budgetary estimate or proposal

Feasibility Critical = required before delivery confidence

Scoring Critical = affects lead quality or routing

Optional Depth = helpful, not mandatory in first pass

34.1 Universal Discovery Core Questions

These questions apply to almost all services.

34.2 Product Sampling — Core Discovery Matrix

34.3 IT Park Sampling — Service-Specific Questions

34.4 RWA / Apartment Sampling — Service-Specific Questions

34.5 Mall Sampling / Mall Activation — Service-Specific Questions

34.6 In-Store / Retail Sampling — Service-Specific Questions

34.7 College / Youth Sampling — Service-Specific Questions

34.8 Gym / Fitness Sampling — Service-Specific Questions

34.9 Brand Activation / Kiosk — Service-Specific Questions

34.10 Retail / In-Store Branding — Service-Specific Questions

34.11 LED Van / Mobile Outreach — Service-Specific Questions

34.12 Hybrid / Multi-Touchpoint Campaign — Service-Specific Questions

34.13 Industry-Specific Question Add-Ons

FMCG / Foods / Snacks

Beauty / Skincare / Personal Care

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

34.14 Question Priority Rules

The Entity Brain should use the following order when choosing the next question: 1. Questions required to understand objective and audience 2. Questions required to identify service fit 3. Questions required to assess timeline and feasibility 4. Questions required to understand scale and budget 5. Questions required to refine proposal quality 6. Optional depth questions only after the above are sufficiently answered

34.15 Stop Rules for Discovery

Discovery should pause and route to the next stage when: - objective is known - target audience is known - geography is known - probable service fit is known - timeline is known at least in band form - budget is known or reasonably inferred for next step - critical feasibility blockers are either known or flagged

If these are not available, the system should not mark the lead as proposal-ready.

34.16 Escalation Rules During Discovery

Escalate to founder or sales head when: - high-value brand but very low confidence - requirement spans multiple service categories with unclear commercial priority - prospect requests final pricing too early without critical data - service fit is ambiguous or appears weak - feasibility risk is high due to timeline, permissions, or category sensitivity - the prospect is a strategic account or marquee brand

34.17 Recommended Next Document

After this Service Taxonomy and Discovery Matrix, the next strongest document is: Scoring Configuration Sheet + Wireframes for Lead Intelligence Dashboard and Live Discovery Assistant

That will convert the logic into usable system behavior and UI structure.

35. Scoring Configuration Sheet

This section defines the detailed scoring logic for AIM Entity Brain.

The purpose of the scoring model is to help AIM: - prioritize the right leads quickly - reduce effort spent on low-fit opportunities - route leads to the right salesperson or escalation path - create a consistent commercial qualification standard across the team - separate exciting leads from actually viable leads

Scoring Design Principles

Score for commercial quality, not just surface interest.

Keep component scores visible; never rely only on one total score.

Distinguish lead attractiveness from execution feasibility.

Penalize missing critical data through completeness and confidence.

Allow founder override, but record it as a learning signal.

35.1 Scoring Model Overview

Total Score = 100

35.2 Fit Score Configuration (0–25)

Objective

Measure how well the lead’s need matches AIM’s services, execution models, and target categories.

Negative Adjustments

Guidance

20–25 = strong fit

14–19 = moderate fit

8–13 = weak fit

below 8 = poor fit or probable misfit

35.3 Authority Score Configuration (0–15)

Objective

Measure whether AIM is speaking to someone who can influence or close the buying decision.

Positive Modifiers

Cap Rule

Authority Score cannot exceed 15.

35.4 Urgency Score Configuration (0–15)

Objective

Measure how time-bound and sales-actionable the opportunity is.

Negative Adjustments

Guidance

Urgency should not overpower feasibility. A rushed but impossible lead is not high-quality.

35.5 Budget Score Configuration (0–15)

Objective

Measure commercial seriousness and likely budget alignment with the probable solution.

Positive Modifiers

Negative Adjustments

Cap Rule

Budget Score cannot exceed 15.

35.6 Completeness Score Configuration (0–10)

Objective

Measure whether enough commercial information exists for meaningful next action.

Critical Fields Considered

service category

campaign objective

target audience

target geography

timeline

scale or sample volume

decision maker status

budget band or budget orientation

Rules

inferred fields contribute less than confirmed fields when calculating completeness confidence

if service category is unknown, completeness cannot exceed 4

if objective is unknown, completeness cannot exceed 5

35.7 Strategic Value Score Configuration (0–10)

Objective

Measure longer-term business value beyond immediate project size.

Rules

Strategic value can increase priority, but cannot override severe feasibility issues.

35.8 Feasibility Score Configuration (0–10)

Objective

Measure whether AIM can realistically execute the requirement as discussed.

Negative Adjustments

Guidance

8–10 = strong feasibility

5–7 = feasible with caution

2–4 = weak feasibility

0–1 = likely not feasible without major clarification

35.9 Confidence Score Configuration (0–100)

Confidence is separate from lead quality.

Objective

Measure how reliable the system’s understanding and recommendations are.

Confidence Inputs

Confidence Bands

80–100 = High Confidence

60–79 = Medium Confidence

Below 60 = Low Confidence

Rules

high-value leads with low confidence should escalate

low confidence should suppress premature proposal-ready status

confidence should drop when fields are contradictory or mostly inferred

35.10 Lead Priority Band Logic

35.11 Routing Rules by Score and Confidence

35.12 SLA Recommendation Rules

35.13 Proposal Readiness Rules Based on Score + Completeness

A lead may be marked:

Ready for Capability Deck

If: - objective known - probable service fit known - target audience known - geography known

Ready for Budgetary Estimate

If: - above capability deck conditions met - timeline band known - scale band or rough volume known - budget orientation known or pilot openness exists

Ready for Scoped Proposal

If: - service/sub-service reasonably clear - geography clear - objective clear - timeline clear - scale clear - budget band known or commercial path agreed - feasibility risk not high - confidence at least medium

Needs Human Review

If: - high value but low confidence - ambiguous service fit - high-risk feasibility - client insists on final quote too early

35.14 Escalation Trigger Rules

Escalate when any of the following is true: - total score >= 80 and confidence < 60 - strategic value score >= 8 and service fit is ambiguous - feasibility score <= 3 but urgency score >= 10 - budget mismatch severe but brand value is high - opportunity spans multiple service lines with unclear primary path - prospect is a marquee account, key founder connection, or board-level contact

35.15 Example Scoring Scenarios

Example A: Strong Skincare Launch Lead

brand manager from known beauty brand

wants Bangalore IT park + mall trial campaign

launch within 30 days

decent budget band disclosed

target audience clear

scale reasonably known

Suggested score: - Fit: 22 - Authority: 11 - Urgency: 12 - Budget: 12 - Completeness: 8 - Strategic: 7 - Feasibility: 7 - Total: 79 - Confidence: 82

Routing: standard qualified priority with fast assignment.

Example B: Marquee Brand, Vague Brief

well-known FMCG brand

asks for “something impactful pan-India”

no budget, no specific audience, no timeline clarity

contact is mid-level marketing executive

Suggested score: - Fit: 15 - Authority: 8 - Urgency: 4 - Budget: 3 - Completeness: 3 - Strategic: 9 - Feasibility: 3 - Total: 45 - Confidence: 42

Routing: founder/sales head review because strategic value is high but clarity is poor.

Example C: Low-Budget Misfit Lead

unknown brand

asks for premium mall activation in multiple cities

budget extremely low and fixed

wants final quote immediately

Suggested score: - Fit: 8 - Authority: 6 - Urgency: 9 - Budget: 1 - Completeness: 5 - Strategic: 2 - Feasibility: 2 - Total: 33 - Confidence: 68

Routing: low priority or disqualify unless client agrees to re-scope.

35.16 Override Rules

Human override should be allowed for: - score correction - strategic value correction - authority correction - feasibility reassessment - routing reassignment

Override Logging Must Capture

who overrode

what changed

why it changed

date/time

logic version originally used

35.17 Recommended Configurability

The following should be admin-configurable: - point values by score band - routing thresholds - SLA thresholds - escalation triggers - strategic account rules - service-specific penalties - proposal readiness gates

35.18 Recommended Next UI Behavior Tied to Scoring

show component scores, not only total score

visually highlight missing critical fields that are reducing score/confidence

display why a score was assigned in plain language

allow human edit for corrected data before score recalculation

clearly show when a high-value lead is being escalated because of low confidence

36. Wireframe Requirements

This section defines the UI structure for the first product version.

The aim is not visual design polish yet. The aim is to make the product buildable by defining the screen structure, information hierarchy, and primary actions.

36.1 Screen: Lead Intelligence Dashboard

Goal

Give sales and leadership a single-pane commercial view of a lead.

Main Sections

Lead Header

Qualification Snapshot

Score and Confidence Panel

Requirement Summary

Missing Information

Recommended Next Step

Solution Recommendation

Case Study Suggestions

Activity Timeline

Layout Suggestion

Left column: lead identity, contact info, company info

Center column: requirement summary, missing data, next questions

Right column: scores, routing, confidence, proposal readiness, escalation flags

Fields to Show

company name

contact name and designation

source channel

service category

sub-service category

industry

target audience summary

geography

timeline band

budget band

total score

component scores

confidence band

proposal readiness

assigned owner

escalation/founder review flag

Key Actions

assign owner

open live discovery assistant

mark as escalate

view recommended case studies

open CRM record

move to proposal stage

log override

Acceptance Criteria

user can understand lead quality in under 30 seconds

user can identify missing critical data without opening another screen

score and confidence are visible at first glance

36.2 Screen: Live Discovery Assistant

Goal

Help salesperson or bot run structured discovery without repetition.

Main Sections

Conversation Stream / Notes

Field Status Tracker

Next-Best Question Suggestions

Captured Answers

Recommendation Preview

Quick Actions

Layout Suggestion

Left panel: transcript or conversation notes

Center panel: structured answer cards and next question suggestions

Right panel: field status, score changes, confidence changes, proposal readiness

Fields to Show

asked questions

skipped questions and reasons

confirmed fields

inferred fields

missing critical fields

next-best questions

current score snapshot

confidence snapshot

Key Actions

ask suggested question

mark answer confirmed

edit field manually

skip question with reason

request founder review

recalculate score

generate summary

Acceptance Criteria

system does not repeat confirmed questions

user can see why the next question is being suggested

score updates after major answer capture

36.3 Screen: Solution Recommendation Panel

Goal

Show the recommended commercial path clearly and explain why it fits.

Main Sections

Primary Recommendation

Alternative Recommendation(s)

Why This Fits

Budget and Timeline Guidance

Risks and Assumptions

Supporting Case Studies

Fields to Show

recommended service mix

recommended touchpoint mix

campaign model (pilot / rollout)

budget band

timeline band

assumptions

exclusions

risks

case study links

Key Actions

accept recommendation

compare alternatives

send to proposal prep

escalate for human review

Acceptance Criteria

user can distinguish recommendation from assumption

user can see at least one reason behind each recommendation

unsupported inactive services are never shown

36.4 Screen: Founder Review Panel

Goal

Allow founder or sales head to quickly correct, approve, or redirect important leads.

Main Sections

Escalation Summary

Lead Snapshot

System Recommendation

Risk / Confidence Indicators

Override Controls

Change Log

Fields to Show

escalation reason

total score and confidence

strategic value score

feasibility score

discovery summary

missing information

recommendation

prior overrides if any

Key Actions

approve recommendation

edit fields

change owner

force proposal stage

mark nurture/disqualify

submit override reason

Acceptance Criteria

founder can make a decision in under 2 minutes for normal escalations

all overrides are logged with reason

system recommendation remains visible alongside override

36.5 Screen: Knowledge Admin Panel

Goal

Allow admin or product team to maintain service logic and question logic.

Main Sections

Services

Industries

Question Banks

Scoring Config

Version History

Case Study Tags

Key Actions

create/edit/archive service

update question conditions

update scoring thresholds

activate new version

rollback version if needed

Acceptance Criteria

admin can update active logic without breaking historical records

version history is visible and searchable

only approved users can publish logic changes

36.6 Cross-Screen Design Requirements

Required Global UI Elements

lead score chip

confidence chip

proposal readiness chip

source channel badge

escalation badge

last updated timestamp

logic version indicator

Required Behaviors

every important AI-generated field should be traceable

human-edited fields should show override marker

screen should clearly separate confirmed vs inferred data

critical missing fields should be visually highlighted

36.7 Recommended Prototype Order

Build wireframes/prototypes in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel

This order matches the sequence of highest business value for AIM.

36.8 Recommended Next Document

After this scoring sheet and wireframe spec, the next most useful document is: API Contract + Event Schema + Pilot Rollout Plan

That will give engineering integration clarity and give leadership a phased implementation path.

37. API Contract Specification

This section defines the recommended API surface for AIM Entity Brain.

The API layer should support: - lead intake - discovery progression - scoring - recommendation generation - CRM sync - founder override - analytics and audit retrieval

API Design Principles

Keep business objects explicit and versioned.

Separate synchronous response APIs from event-driven workflow updates.

Ensure all AI-generated outputs can be traced to model version and logic version.

Use structured request and response bodies.

Keep human override endpoints first-class, not as afterthoughts.

Base Objects

Lead

Discovery Session

Discovery Answer

Score Snapshot

Recommendation Snapshot

CRM Sync Result

Override Record

Outcome Record

Knowledge Version

37.1 API Authentication and Access Model

Recommended Access Types

Internal Service Token for backend-to-backend integrations

Role-based User Auth for admin, sales, founder, ops, CRM admin

Channel Auth for website bot, WhatsApp connector, and later voice stack

Recommended Roles

Admin

Sales User

Sales Head

Founder Reviewer

Ops User

CRM Admin

Read-Only Analytics User

Authorization Rules

Sales users can read and update assigned leads and discovery sessions

Founders and sales heads can override recommendations and scores

Admins can update knowledge logic, scoring thresholds, and service records

CRM Admins can manage sync configuration and duplicate detection rules

37.2 Lead Intake API

Endpoint

POST /api/v1/leads/intake

Purpose

Create or update an incoming lead from website, WhatsApp, email, phone, or manual entry.

Request Body

{

"source_channel": "website",

"lead_origin_type": "inbound",

"company_name": "Example Brand",

"contact_name": "Priya Sharma",

"designation": "Brand Manager",

"email": "priya@example.com",
"phone": "+919999999999",
"raw_message": "We want to do a skincare sampling campaign in Bangalore.",
"campaign_source": "google_ads",
"campaign_medium": "cpc",
"campaign_name": "sampling_q2"
}

Response Body

{
"lead_id": "LD-000124",
"matched_existing_lead": false,
"discovery_session_id": "DS-00987",
"classification_status": "pending",
"message": "Lead intake successful"
}

Rules

duplicate detection should run before creating a new lead

if confidence of duplicate match is high, update existing lead instead of creating new one

raw inbound message should be stored separately from structured summary

37.3 Lead Classification API

Endpoint

POST /api/v1/leads/{lead_id}/classify

Purpose

Classify service category, industry, probable objective, and priority context from existing lead data.

Response Body

{
"lead_id": "LD-000124",
"industry_primary": "Beauty / Skincare",
"service_category": "Product Sampling",
"sub_service_category": "IT Park Sampling",
"campaign_objective_primary": "Product Trial",
"confidence_score": 74,
"logic_version_used": "v1.0.3",
"model_version_used": "gpt-x.x"

}

Rules

classification should always preserve confidence and origin metadata

if classification confidence is low, discovery should remain broad until clarified

37.4 Discovery Session Create API

Endpoint

POST /api/v1/discovery-sessions

Purpose

Create a structured discovery session tied to a lead.

Request Body

{
"lead_id": "LD-000124",
"channel": "sales_copilot",
"initiated_by": "sales_user_17"
}

Response Body

{
"discovery_session_id": "DS-00987",
"lead_id": "LD-000124",
"status": "active"
}

37.5 Next-Best Question API

Endpoint

GET /api/v1/discovery-sessions/{discovery_session_id}/next-question

Purpose

Return the most relevant next question based on current field state.

Response Body

{
"question_id": "Q-112",
"question_text": "Approximately how many samples are you planning to deploy in phase 1?",
"question_type": "Quote Critical",
"reason": "Sample volume is required to estimate campaign scope and budget band.",
"field_to_populate": "sample_volume_estimate",
"priority": 1

}

Rules

must not return a question already confirmed unless clarification flag exists

should include plain-language reason so the salesperson understands why it matters

37.6 Discovery Answer Capture API

Endpoint

POST /api/v1/discovery-sessions/{discovery_session_id}/answers

Purpose

Capture a prospect answer and update structured fields.

Request Body

{
"question_id": "Q-112",
"answer_text": "We are planning around 10,000 units for the first phase.",
"captured_by": "sales_user_17",
"answer_source": "human_entered"
}

Response Body

{
"lead_id": "LD-000124",
"updated_fields": [
{
"field": "sample_volume_estimate",
"value": 10000,
"status": "confirmed"
}
],
"score_recalculated": true,
"proposal_readiness_status": "Ready for Budgetary Estimate"
}

Rules

every captured answer should generate field updates, audit records, and optional score recalculation

AI-normalized values should preserve original answer text for traceability

37.7 Discovery Summary API

Endpoint

GET /api/v1/leads/{lead_id}/discovery-summary

Purpose

Return a structured summary of all known, inferred, and missing commercial information.

Response Body

{

"lead_id": "LD-000124",

"summary": "Beauty brand exploring Bangalore IT park sampling for skincare launch within 30 days.",

"confirmed_fields": {

"industry_primary": "Beauty / Skincare",

"service_category": "Product Sampling",

"sample_volume_estimate": 10000

},

"inferred_fields": {

"budget_band": "3L–10L"

},

"missing_fields": [

"exact touchpoint split",

"branding scope"

]

}

37.8 Score Calculation API

Endpoint

POST /api/v1/leads/{lead_id}/score

Purpose

Recalculate all component scores and total lead score.

Response Body

{

"lead_id": "LD-000124",

"fit_score": 22,

"authority_score": 11,

"urgency_score": 12,

"budget_score": 10,

"completeness_score": 8,

"strategic_value_score": 6,

"feasibility_score": 7,

"total_lead_score": 76,

"lead_priority_band": "Qualified Priority",

"confidence_score": 81,

"confidence_band": "High"

}

Rules

every scoring response must include component-level outputs

score recalculation should happen automatically after critical field changes and optionally on demand

37.9 Recommendation API

Endpoint

POST /api/v1/leads/{lead_id}/recommendation

Purpose

Generate service, touchpoint, and next-step recommendation.

Response Body

{

"lead_id": "LD-000124",

"recommended_service_mix": [

"IT Park Sampling",

"Mall Sampling"

],

"recommended_campaign_model": "Pilot",

"budget_band": "3L–10L",

"timeline_band": "Within 30 Days",

"recommended_case_studies": [

"CS-101",

"CS-117"

],

"risks": [

"Branding scope not yet defined"

],

"assumptions": [

"Single-city phase 1"

]
}

Rules

should not generate unsupported service recommendations

must preserve assumptions explicitly

low confidence recommendations should include human review flag

37.10 Proposal Readiness API

Endpoint

GET /api/v1/leads/{lead_id}/proposal-readiness

Purpose

Return readiness status for capability deck, budgetary estimate, or scoped proposal.

Response Body

{
"lead_id": "LD-000124",
"proposal_readiness_status": "Ready for Budgetary Estimate",
"quote_readiness_status": "Needs More Discovery",
"missing_critical_fields": [
"branding scope"
],
"recommended_next_action": "Clarify branding requirement before final proposal"
}

37.11 CRM Sync API

Endpoint

POST /api/v1/leads/{lead_id}/sync-crm

Purpose

Push or update lead intelligence in CRM.

Response Body

{
"lead_id": "LD-000124",
"crm_record_id": "CRM-77812",
"sync_status": "success",
"updated_fields_count": 21,
"owner_assigned": "Vidhya",
"sla_priority": "High"

}

Rules

all sync attempts should create audit records

CRM sync failures should create retryable system events

37.12 Founder Override API

Endpoint

POST /api/v1/leads/{lead_id}/override

Purpose

Allow founder or sales head to modify scores, routing, service recommendations, or readiness states.

Request Body

{

"override_type": "service_correction",

"changed_fields": {

"sub_service_category": "Mall Sampling"

},

"reason": "Better TG fit for premium skincare positioning",

"overridden_by": "founder_user_01"

}

Response Body

{

"lead_id": "LD-000124",

"override_record_id": "OV-6612",

"status": "applied",

"learning_signal_created": true

}

Rules

all overrides must capture before/after values and reason

override should trigger refreshed summary and optional re-score

37.13 Outcome Logging API

Endpoint

POST /api/v1/leads/{lead_id}/outcome

Purpose

Store win/loss and outcome reason for learning and analytics.

Request Body

{
"outcome_status": "won",
"outcome_reason": "Budget aligned and pilot approved",
"recorded_by": "sales_head_01"
}

37.14 Knowledge Management APIs

Recommended Endpoints

POST /api/v1/knowledge/services

PATCH /api/v1/knowledge/services/{service_id}

POST /api/v1/knowledge/questions

PATCH /api/v1/knowledge/questions/{question_id}

POST /api/v1/knowledge/industries

POST /api/v1/knowledge/case-studies

POST /api/v1/knowledge/versions/publish

POST /api/v1/knowledge/versions/rollback

Rules

only approved roles can publish new logic version

version metadata must be preserved on all production decisions

37.15 Analytics APIs

Recommended Endpoints

GET /api/v1/analytics/lead-quality

GET /api/v1/analytics/question-quality

GET /api/v1/analytics/override-patterns

GET /api/v1/analytics/conversion-by-score-band

GET /api/v1/analytics/discovery-completeness

37.16 Error Handling Standards

Common Error Types

validation_error

duplicate_lead_conflict

knowledge_version_not_found

low_confidence_block

crm_sync_failure

permission_denied

unsupported_service_path

Error Response Format

{

"error_code": "validation_error",

"message": "service_category is required for scoring",

"details": {

"field": "service_category"

}

}

38. Event Schema Specification

This section defines the event-driven model for AIM Entity Brain.

The event layer should power: - auditability - retries - analytics - downstream integrations - async workflow automation

Event Design Principles

Every material lead-state change should emit an event.

Events should be idempotent-friendly.

Events should include source, timestamp, lead ID, and version metadata.

Failure-prone external integrations should be event-driven where possible.

Standard Event Envelope

{

"event_id": "EV-90001",

"event_type": "lead.created",

"occurred_at": "2026-04-04T12:15:00Z",

"lead_id": "LD-000124",

"source": "website_bot",

"logic_version_used": "v1.0.3",

"model_version_used": "gpt-x.x",

"payload": {}

}

38.1 Core Lead Events

lead.created

When a new lead record is created.

lead.updated

When major lead data is updated.

lead.matched_existing

When intake resolves to an existing lead rather than creating a new one.

lead.assigned

When owner/team assignment occurs.

lead.escalated

When founder or sales-head review is triggered.

lead.disqualified

When lead is marked low-fit or unviable.

38.2 Discovery Events

discovery.started

When a discovery session begins.

discovery.question.served

When next-best question is generated and shown.

discovery.answer.captured

When an answer is stored.

discovery.field.updated

When a structured field changes.

discovery.summary.generated

When a summary is refreshed.

discovery.completed

When minimum discovery threshold is reached.

38.3 Scoring and Recommendation Events

score.calculated

When score snapshot is recalculated.

confidence.updated

When confidence changes materially.

recommendation.generated

When solution recommendation is produced.

proposal.readiness.changed

When readiness status changes.

38.4 CRM and Workflow Events

crm.sync.requested

When CRM sync is triggered.

crm.sync.succeeded

When CRM sync succeeds.

crm.sync.failed

When CRM sync fails.

task.created

When follow-up or review task is created.

sla.priority.changed

When SLA classification changes.

38.5 Human Review Events

override.created

When a founder or sales head override is submitted.

override.applied

When override has been written into active lead state.

review.approved

When escalation is approved without changes.

review.reassigned

When ownership or path is changed in review.

38.6 Learning and Outcome Events

outcome.recorded

When win/loss is captured.

analytics.snapshot.generated

When periodic analytics jobs are run.

knowledge.version.published

When new logic goes live.

knowledge.version.rolled_back

When version rollback happens.

38.7 Example Event Payloads

Example: score.calculated

{

"event_id": "EV-90002",

"event_type": "score.calculated",

"occurred_at": "2026-04-04T12:30:00Z",

"lead_id": "LD-000124",

"source": "scoring_engine",

"logic_version_used": "v1.0.3",

"payload": {

"fit_score": 22,
"authority_score": 11,
"urgency_score": 12,
"budget_score": 10,
"completeness_score": 8,
"strategic_value_score": 6,
"feasibility_score": 7,
"total_lead_score": 76,
"lead_priority_band": "Qualified Priority"
}
}

Example: lead.escalated

{
"event_id": "EV-90003",
"event_type": "lead.escalated",
"occurred_at": "2026-04-04T12:35:00Z",
"lead_id": "LD-000124",
"source": "orchestrator",
"payload": {
"reason": "High value but low confidence",
"recommended_reviewer_role": "Founder Reviewer"
}
}

38.8 Event Consumers

Recommended Consumers

CRM integration worker

analytics worker

notification service

founder review queue service

task creation service

audit log service

model evaluation pipeline

38.9 Retry and Failure Handling

Recommended Rules

CRM sync failures should retry with backoff

external messaging failures should be logged and retried separately

score/recommendation failures should not corrupt existing lead state

failed async consumers should push to dead-letter queue after retry threshold

39. Pilot Rollout Plan

This section defines how AIM should launch the first working version of Entity Brain.

The goal is not to automate everything at once. The goal is to prove business value safely and quickly.

Pilot Principles

Start with high-frequency, commercially important services.

Use internal sales copilot first.

Keep founder feedback tightly looped during the pilot.

Measure both system accuracy and business impact.

Expand only after question quality and routing quality stabilize.

39.1 Recommended Pilot Scope

Phase 1 Pilot Services

Start with the services that most directly affect AIM's current commercial motion: 1. Product Sampling - IT Park Sampling - RWA / Apartment Sampling - Mall Sampling - In-Store / Retail Sampling 2. Brand Activation - Kiosk-Based Activation - Product Demo / Trial Booth 3. Transit / Mobile Outreach - LED Van Campaign

Why These First

they are core to AIM's sales motion

they have repeatable commercial logic

they frequently require founder intervention today

they are good training ground for discovery quality

39.2 Recommended Pilot Users

Internal Users

1 Sales Head / reviewer

2 Sales users

1 Founder reviewer

1 Ops reviewer

1 Product / admin owner

Suggested AIM Pilot Roles

Sales Head: oversight and override review

Sales Users: primary copilot users during discovery

Founder: weekly quality review and escalations

Ops: feasibility validation feedback

Admin/Product: maintain knowledge updates and scoring thresholds

39.3 Recommended Pilot Channels

Start With

manual lead entry through sales copilot

website inbound leads summarized into system

WhatsApp inbound leads processed through structured intake

Defer Initially

fully autonomous public chatbot

voice outbound automation

automated proposal generation without review

39.4 Pilot Success Criteria

Operational Success Metrics

reduction in founder interruptions per lead

increase in discovery completeness score

reduction in average time to proposal readiness

reduction in missing critical fields at proposal stage

Quality Metrics

duplicate question rate below agreed threshold

score accuracy vs sales-head review

recommendation usefulness rating from sales team

feasibility flag accuracy from ops review

Commercial Metrics

improved lead prioritization quality

faster response on high-intent leads

improved proposal conversion on qualified leads

39.5 Pilot KPI Targets (Recommended Starting Benchmarks)

These can be tuned once AIM sets a baseline.

39.6 Pilot Rollout Stages

Stage 0: Preparation (Week 1–2)

finalize pilot services

finalize scoring thresholds

finalize question banks

finalize CRM field map

onboard pilot users

define feedback review cadence

Stage 1: Internal Copilot Shadow Mode (Week 3–4)

sales team continues normal process

system runs in parallel and suggests questions/scores

compare system suggestions against actual sales actions

log gaps and override patterns

Stage 2: Assisted Live Mode (Week 5–6)

sales team actively uses copilot during discovery

founder reviews escalated leads

ops validates feasibility flags

CRM sync used for pilot leads

Stage 3: Controlled Operational Mode (Week 7–8)

selected website and WhatsApp leads enter through system

discovery summaries auto-generated

scoring/routing used for working decisions

weekly logic tuning based on outcomes

Stage 4: Pilot Review and Expansion Decision (Week 9)

review business metrics

review override patterns

review question quality

review routing accuracy

decide go/no-go for discovery bot expansion

39.7 Pilot Governance Cadence

Daily

review sync failures

review escalations

review major overrides

Weekly

founder review of top escalations

sales feedback review

ops feedback review

scoring and question quality review

End of Pilot

compare baseline vs pilot performance

identify service gaps

finalize phase 2 expansion plan

39.8 Recommended Pilot Review Template

Each week, review: - number of pilot leads processed - score distribution - confidence distribution - average completeness score - number of escalations - number of overrides - most common missing fields - most common weak questions - most common misclassification issues - proposal-readiness accuracy - notable wins/losses

39.9 Expansion Criteria After Pilot

Expand to next phase only if: - discovery quality is stable - duplicate questioning is low - sales users trust the copilot - founder override rate is reducing meaningfully - CRM sync reliability is acceptable - recommendation usefulness is consistently positive

Phase 2 Expansion Candidates

more retail branding workflows

more hybrid campaign paths

customer-facing discovery bot

Phase 3 Expansion Candidates

voice prospecting engine

semi-automated outbound qualification

deeper proposal automation

39.10 Recommended Ownership Model

39.11 Recommended Next Document

After this implementation specification, the next best documents are: 1. Figma wireframes or clickable prototype for the key screens 2. Engineering task breakdown by module 3. Data migration / knowledge ingestion plan 4. Pilot operating SOP for sales and founder reviewers

These will take AIM from planning into active build execution.

40. Engineering Task Breakdown by Module

This section translates the product specification into executable workstreams for engineering, product, and operations.

The purpose of this breakdown is to help AIM: - estimate build effort - allocate ownership across backend, frontend, product, and integrations - sequence the build properly - avoid building UI before core logic and data structures exist

Workstream Design Principles

Build core data and logic before advanced UI.

Separate platform foundations from user-facing features.

Deliver the internal sales copilot first.

Keep every workstream testable in isolation.

Treat knowledge quality as a product dependency, not just content work.

40.1 Workstream Overview

40.2 Workstream 1: Platform Foundation

Objective

Create the underlying application infrastructure needed for secure, traceable, versioned operations.

Key Tasks

set up environments: dev, staging, production

implement auth and RBAC

define core database schema

set up audit logging framework

set up file/retrieval storage connectors

set up event bus / queue mechanism

define API versioning approach

implement observability basics (logs, metrics, errors)

Deliverables

environment setup checklist

RBAC matrix

initial database schema migrations

logging and monitoring setup

API gateway/base framework

Dependencies

none, this starts first

Acceptance Criteria

authenticated internal users can access system based on role

all API calls are logged with user/service identity

core objects can be persisted in database

40.3 Workstream 2: Knowledge Core Implementation

Objective

Build the structured knowledge layer and admin-ready data foundations.

Key Tasks

implement services table and CRUD APIs

implement sub-services table and relationships

implement industry playbook table and CRUD APIs

implement discovery question table with conditional fields

implement case-study metadata model

implement scoring config tables

implement knowledge versioning model

build import templates for structured data uploads

Deliverables

service and sub-service APIs

question bank APIs

industry playbook APIs

case-study metadata APIs

versioning schema

admin import template sheets

Dependencies

Platform Foundation

Acceptance Criteria

admin can create and retrieve structured service and question records

knowledge version can be tagged and retrieved by live engine

inactive knowledge does not appear in live recommendations

40.4 Workstream 3: Retrieval and Knowledge Access Layer

Objective

Enable the system to fetch relevant long-form context such as case studies, SOPs, and proposal archives.

Key Tasks

define retrieval corpus types

build document ingestion pipeline for approved files

tag documents with service/industry metadata

implement retrieval APIs

support filtered retrieval by service, industry, geography, and objective

store retrieval trace metadata alongside outputs

Deliverables

retrieval corpus structure

metadata schema

filtered retrieval endpoint

retrieval trace logging

Dependencies

Platform Foundation

Knowledge Core

Acceptance Criteria

system can retrieve relevant case studies based on service and industry filters

retrieval results include source metadata for auditability

40.5 Workstream 4: Orchestration Engine

Objective

Build the decision layer that runs classification, questioning, scoring, and recommendations.

Key Tasks

implement lead classification service

implement field-state manager

implement next-best-question selector

implement duplicate-question prevention logic

implement scoring engine

implement confidence engine

implement recommendation engine

implement proposal-readiness engine

implement escalation rules

Deliverables

orchestrator service

field-state logic

question selection service

scoring service

recommendation service

readiness service

Dependencies

Knowledge Core

Retrieval Layer

CRM field mapping

Acceptance Criteria

system can generate next-best question based on lead state

score updates when critical fields change

recommendation output includes assumptions and risks

low-confidence high-value leads escalate correctly

40.6 Workstream 5: Lead and Discovery APIs

Objective

Expose the engine through stable APIs for UI and integrations.

Key Tasks

build lead intake endpoint

build lead classification endpoint

build discovery session create endpoint

build answer capture endpoint

build score and recommendation endpoints

build proposal-readiness endpoint

build override endpoint

build outcome logging endpoint

Deliverables

API contracts implemented

API validation layer

API error handling and response standards

Dependencies

Orchestration Engine

Platform Foundation

Acceptance Criteria

all critical API flows work in staging

APIs return structured objects matching the contract spec

validation errors are explicit and recoverable

40.7 Workstream 6: CRM & Workflow Integration

Objective

Push lead intelligence into CRM and trigger assignment/action workflows.

Key Tasks

implement CRM create/update sync

implement duplicate lead handling logic

implement owner assignment rules

implement task creation rules

implement SLA tagging

implement sync retry handling and error logging

implement event-triggered workflow updates

Deliverables

CRM sync service

workflow task service

owner assignment engine

SLA priority logic

Dependencies

Lead and Discovery APIs

Event Schema

CRM field mapping

Acceptance Criteria

pilot leads sync into CRM with mapped structured fields

sync failures are logged and retryable

owner assignment follows routing rules

40.8 Workstream 7: Sales Copilot Frontend

Objective

Create the primary working interface for internal sales usage.

Key Tasks

build Lead Intelligence Dashboard UI

build Live Discovery Assistant UI

build score/confidence panels

build missing-field tracker UI

build summary and recommendation cards

build action buttons for assign, escalate, rescore, sync

Deliverables

sales copilot screens

responsive layouts for desktop use

state management for live discovery

Dependencies

Lead and Discovery APIs

scoring and recommendation outputs

Acceptance Criteria

salesperson can complete a structured discovery flow from one interface

UI shows confirmed vs inferred vs missing fields clearly

next-best question can be used during live calls

40.9 Workstream 8: Founder Review Frontend

Objective

Create the escalation review and override interface.

Key Tasks

build review queue screen

build Founder Review Panel

build override form and reason capture

build before/after comparison UI

build override history display

Deliverables

founder review queue

override interaction flow

audit-friendly change display

Dependencies

override APIs

score and recommendation APIs

Acceptance Criteria

founder can review and override an escalated lead quickly

every override is captured with reason and before/after state

40.10 Workstream 9: Knowledge Admin Frontend

Objective

Allow controlled maintenance of services, questions, scoring, and knowledge versions.

Key Tasks

build service management screens

build industry playbook screens

build question-bank editor

build scoring config editor

build publish/rollback version controls

build case-study metadata management interface

Deliverables

admin console for knowledge updates

publish and rollback workflow

Dependencies

Knowledge Core APIs

auth and role controls

Acceptance Criteria

authorized admin can update logic without engineering support

published logic version is visible to live engine and audit logs

40.11 Workstream 10: Analytics, Audit, and Evaluation

Objective

Measure system quality and pilot business impact.

Key Tasks

build lead-quality analytics

build override analytics

build discovery completeness analytics

build question-quality analytics

build conversion-by-score dashboards

build audit trail views

implement model trace storage for major decisions

Deliverables

pilot analytics dashboard

audit export/reporting capability

quality monitoring views

Dependencies

event schema

outcome logging

overrides

Acceptance Criteria

pilot team can review weekly quality and impact metrics

every major decision state has trace metadata available

40.12 Workstream 11: QA, Testing, and Evaluation Harness

Objective

Validate that the system behaves reliably across real AIM scenarios.

Key Tasks

create scenario test library by service and industry

create expected-answer and expected-question test cases

build regression checks for score/routing logic

build duplicate-question test set

build misfit lead test set

run founder-reviewed evaluation cycles

Deliverables

scenario library

acceptance test checklist

regression test suite

pilot issue triage template

Dependencies

all major modules

Acceptance Criteria

core scenarios pass acceptance checks before live pilot expansion

repeated regressions are visible before release

40.13 Suggested Sprint-Level Build Sequence

Sprint A

Platform Foundation

base database schema

auth and roles

event envelope setup

Sprint B

Knowledge Core APIs

import templates

service and question models

Sprint C

Orchestration basics

classification

field-state tracking

next-best question service

Sprint D

scoring engine

confidence engine

recommendation engine

readiness engine

Sprint E

lead/discovery APIs

CRM sync basics

owner assignment

Sprint F

Sales Copilot UI

Lead Intelligence Dashboard

Live Discovery Assistant

Sprint G

Founder Review UI

override flow

analytics basics

Sprint H

hardening, QA, pilot support, weekly logic tuning

40.14 Resourcing Recommendation

Minimum Practical Product Team

1 Product Owner / Product Manager

1 Backend Engineer

1 Frontend Engineer

1 Full-stack or Integration Engineer

1 QA / Test Engineer (shared is acceptable initially)

1 Knowledge Ops / Product Admin

1 Founder / Sales Head reviewer for weekly logic tuning

Optional but Valuable

1 AI / Prompt / Eval specialist

1 Data analyst for pilot measurements

40.15 Build Risk Notes

Likely Risk Areas

weak initial knowledge quality

over-complex orchestration too early

CRM sync mismatch with existing workflow

sales UI becoming too heavy for live usage

lack of consistent override reviews

Recommended Mitigation

keep pilot scope narrow

build observable state and logs first

tune on real lead scenarios weekly

keep human override easy and visible

41. Knowledge Ingestion Plan

This section defines how AIM should convert existing founder knowledge, case studies, service know-how, and past assets into usable Entity Brain knowledge.

The goal is to avoid a common failure mode: uploading lots of documents but not creating usable decision intelligence.

Ingestion Principles

Do not treat raw documents as the final brain.

Normalize critical knowledge into structured entities.

Preserve source links and provenance for every ingested fact.

Separate evergreen logic from temporary campaign-specific data.

Use founder review to validate the first structured versions.

41.1 Knowledge Source Categories

Structured Knowledge Sources

service lists

pricing frameworks

deliverable templates

approval matrices

routing rules

scoring rules

CRM fields

Semi-Structured Sources

proposals

SOWs

capability decks

case study decks

service one-pagers

questionnaire sheets

Unstructured Sources

founder voice notes or explanations

call transcripts

WhatsApp discussions

email threads

internal notes

meeting summaries

Operational Sources

execution SOPs

permission notes

city-level constraints

staffing assumptions

turnaround benchmarks

41.2 What Must Be Structured First

The first structured ingestion wave should prioritize: 1. services and sub-services 2. discovery questions 3. quote-critical inputs 4. feasibility-critical inputs 5. scoring logic 6. routing rules 7. high-value case studies 8. common objections and good responses

This is more important than bulk-importing every old document.

41.3 Ingestion Pipeline Stages

Stage 1: Inventory

Collect and list all existing knowledge assets.

Tasks

create source inventory spreadsheet

identify owner of each source

classify source type

tag source freshness

tag source business relevance

Output

A master inventory of AIM knowledge assets.

Stage 2: Prioritization

Decide what should be ingested first.

Priority Order

high-frequency services

current sales-useful documents

repeatable pricing and discovery logic

proven case studies

founder explanations of nuanced commercial decisions

Output

Ingestion priority backlog.

Stage 3: Extraction

Extract commercially relevant facts and patterns from sources.

Tasks

identify service definitions

identify required questions

identify pricing drivers

identify feasibility dependencies

identify common misfit cases

identify objections and winning pitch angles

identify scoring signals

Output

Raw extracted insight sheets by source.

Stage 4: Normalization

Convert extracted insights into structured objects.

Convert Into

service records

question bank records

case-study records

scoring config records

objection records

proposal module records

feasibility notes

Output

Structured import-ready data.

Stage 5: Validation

Have founder / sales head / ops validate structured data.

Validation Focus

is this commercially true?

is anything important missing?

is this outdated?

does this apply generally or only in specific cases?

Output

Approved version 1 structured knowledge pack.

Stage 6: Publication

Push approved knowledge to live/staging environment.

Output

Published knowledge version with changelog.

41.4 Knowledge Inventory Template

Recommended Columns

source_id

source_name

source_type

owner

service_tags

industry_tags

document_date

current_relevance

ingestion_priority

status

notes

Recommended Status Values

Not Reviewed

Prioritized

Extracted

Normalized

Validated

Published

Archived

41.5 Founder Knowledge Capture Plan

A large part of AIM’s advantage lives in founder reasoning, not documents.

Recommended Capture Methods

structured founder interviews by service

scenario-based workshops

win/loss debrief capture

proposal review deconstruction

override explanation logging during pilot

Best Format for Capture

For each service, ask founders to explain: - when this service is the right fit - when it is the wrong fit - what questions they ask first - what information they must know before quoting - what usually goes wrong - what makes a lead exciting but risky - what they would recommend instead in edge cases

Output

Founder reasoning sheets that can be normalized into rules and question banks.

41.6 Service-by-Service Ingestion Template

For each active service, capture the following: - service name - service description - ideal use cases - non-ideal use cases - best-fit industries - key target audiences - mandatory quote inputs - mandatory feasibility inputs - pricing drivers - common objections - recommended pitch angles - supporting case studies - risk notes - common substitutions or alternatives

This template should be completed before activating a service in pilot scope.

41.7 Case Study Ingestion Template

For each case study, capture: - case_study_id - client category - industry - service used - objective - target audience - geography - campaign scale - execution summary - outcome/result - lessons learned - where this case study is useful in sales - proof assets available

Important Rule

Do not store case studies only as PDFs or slides. Create metadata and structured tags first.

41.8 Proposal and SOW Ingestion Guidance

Past proposals and SOWs are valuable, but they should not be imported blindly.

Extract Only

service scope patterns

exclusions patterns

pricing drivers

deliverable blocks

assumptions patterns

client-specific modifications

Do Not Reuse Blindly

outdated pricing

one-off exceptional commercial concessions

old timelines that no longer reflect ops reality

custom clauses from unusual clients unless explicitly tagged

41.9 Objection and Pitch-Angle Ingestion Plan

The Entity Brain should know not just what AIM sells, but how AIM sells it.

Extract and Structure

common objections by service

common objections by industry

strong responses that work

proof points needed to support the response

when to shift to pilot-first recommendation

when to reposition the service mix

Example Tags

budget objection

timeline objection

feasibility objection

“why this touchpoint” objection

attribution objection

trust / credibility objection

41.10 Ops and Feasibility Knowledge Ingestion

This is critical so sales logic stays grounded.

Capture

permission dependencies by touchpoint

lead-time norms by service

production/fabrication constraints

manpower assumptions

city-specific constraints

compliance or handling considerations

reporting limitations

Why It Matters

Without this layer, the brain will oversell and under-warn.

41.11 Suggested Ingestion Sequence for AIM

Wave 1: Pilot-Critical Knowledge

Product Sampling

IT Park Sampling

RWA Sampling

Mall Sampling

In-Store Sampling

Kiosk Activation

LED Van

related case studies

related objections

related feasibility notes

Wave 2: Expansion Knowledge

retail branding

hybrid solutions

workplace activation variants

college and gym expansions

Wave 3: Advanced Learning Knowledge

call transcripts

win/loss notes

founder override logs

response quality patterns

41.12 Ingestion Roles and Ownership

41.13 Quality Checks for Ingested Knowledge

Before publishing a knowledge pack, confirm: - the service definition is current - the question set is not repetitive - quote inputs are sufficient but not excessive - feasibility notes are grounded in real ops constraints - case-study tags are accurate - scoring signals are commercially sensible - outdated pricing or one-off exceptions are excluded or clearly tagged

41.14 Knowledge Freshness Policy

Recommended Review Frequency

service logic: monthly or when service changes

pricing drivers: monthly or on commercial change

case studies: as new ones become available

feasibility rules: whenever ops constraints change

scoring logic: weekly during pilot, then monthly

Freshness Labels

Current

Needs Review

Archived

Historical Reference Only

41.15 Recommended First 30-Day Ingestion Plan

Week 1

build source inventory

prioritize pilot services

define ingestion templates

Week 2

extract and normalize pilot service logic

capture founder reasoning for pilot services

capture top 10–20 questions per pilot service

Week 3

ingest top case studies and objections

ingest feasibility constraints

validate with founder and ops

Week 4

publish v1 knowledge pack

begin pilot usage

start override-driven refinement cycle

41.16 Common Ingestion Mistakes to Avoid

uploading decks without extracting structured logic

mixing outdated and current pricing assumptions

storing founder insights only in free-text notes

failing to distinguish service rules from client-specific exceptions

skipping ops validation

activating too many services before the pilot logic is stable

41.17 Recommended Next Document

After this engineering breakdown and knowledge ingestion plan, the next strongest documents are: 1. Pilot Operating SOP for Sales, Founder Review, and Ops 2. Figma wireframe prompt / UI spec for prototype creation 3. Engineering estimation sheet by workstream and sprint

These will move AIM from planning into execution governance.

42. Pilot Operating SOP

This section defines how AIM should operate the Entity Brain during the pilot.

The purpose of this SOP is to ensure that the pilot is not treated as only a software test. It must function as an operating system test across sales, founder review, ops validation, and product/admin tuning.

SOP Principles

Sales should use the copilot during real discovery, not only after the call.

Founder review should focus on high-value ambiguity, not routine lead handling.

Ops should validate feasibility signals before overpromising becomes a pattern.

Every override and correction should improve the system.

Weekly review must convert pilot observations into logic updates.

42.1 Pilot Roles and Responsibilities

42.2 Daily Operating Flow

Step 1: Lead Intake

All pilot leads should enter through one of these routes: - direct intake into sales copilot - website lead synced into system - WhatsApp inquiry entered or connected into system

Sales User Action

open or create lead in system

review initial classification

confirm obvious identity details

start discovery session

System Action

create or update lead

classify probable service and industry

begin discovery state

suggest next-best question

42.3 Sales Discovery SOP

When to Use Copilot

Sales should use the copilot during: - first discovery call - WhatsApp clarification chat - email-based requirement clarification - follow-up call before proposal preparation

Sales User Must Do

review the lead summary before speaking

ask suggested questions where relevant

mark answers as confirmed when prospect states them clearly

correct inferred fields if needed

avoid skipping critical questions without reason

check proposal-readiness before asking for internal pricing/proposal prep

Sales User Must Not Do

ignore missing critical fields and still request final proposal

override recommendation without reason

assume inferred fields are confirmed facts

promise feasibility where the system has flagged risk without validation

Minimum Sales Checklist Before Moving Lead Forward

objective captured

target audience captured

geography captured

timeline captured in at least band form

service direction reasonably clear

budget orientation captured or at least discussed

major feasibility blockers flagged if known

42.4 Founder Review SOP

When a Lead Must Be Escalated

Escalate when: - score is high but confidence is low - lead is strategically valuable or marquee - service fit is ambiguous across multiple AIM services - client is pushing for final pricing without enough discovery - feasibility risk is high due to timeline, permissions, or category sensitivity - salesperson is unable to determine commercial direction confidently

Founder Reviewer Must Do

review system summary, score, confidence, and missing fields

assess whether the issue is discovery quality, service fit, or feasibility

approve, edit, or override the system recommendation

record override reason in clear business language

identify whether logic update is needed for similar future cases

Founder Reviewer Must Not Do

rewrite the whole brief without preserving why the system was wrong

bypass logging because the lead seems obvious

let urgent but low-feasibility leads proceed without caution notes

Target Review Time

For standard escalations, founder review should ideally be completed in a short focused window, with a practical goal of rapid turnaround during business hours.

42.5 Ops Validation SOP

When Ops Should Be Involved

Ops should validate when: - permissions are a likely blocker - timeline is aggressive - product handling/storage requirements are unclear - branding/fabrication scope affects feasibility - multi-touchpoint complexity is high - retail or venue approvals are required

Ops Reviewer Must Do

review the relevant lead summary and risk flags

confirm or correct feasibility assumptions

identify hidden ground constraints

flag unrealistic commitments before proposal stage

suggest safer execution model where needed

Ops Reviewer Output

feasible

feasible with caution

not feasible without changes

needs more information

This output should be captured in system notes and reflected in feasibility score updates.

42.6 Sales Head Monitoring SOP

Sales Head Responsibilities

review the day’s high-priority leads

review leads stuck in discovery too long

monitor whether sales team is using the copilot properly

review major override patterns

identify where training vs logic improvement is needed

Daily Review Focus

high-priority leads not yet assigned

high-score leads with missing critical fields

repeated founder escalations of the same kind

low-confidence recommendations on important leads

42.7 Product/Admin Operating SOP

Daily Responsibilities

review system errors

review CRM sync failures

review duplicate lead issues

review major logic failures reported by users

track unresolved pilot bugs

Weekly Responsibilities

prepare pilot metrics summary

prepare top override patterns

prepare top weak-question patterns

prepare top misclassification patterns

prepare knowledge update recommendations

Product/Admin Must Do

maintain issue log with severity

tag issues as product, knowledge, scoring, ops, CRM, or training

ensure approved logic changes move through version control

42.8 Daily Cadence

Start of Day

Sales Head / Product Admin should review: - open high-priority leads - pending escalations - sync failures - prior day unresolved issues

During Day

Sales users should: - use the copilot live during active discovery - escalate only when rule conditions are met - avoid offline notes that never enter the system

End of Day

Sales Head / Product Admin should review: - leads processed during the day - new overrides - leads stuck without next action - recurring missing fields

42.9 Weekly Review Cadence

A structured weekly review is mandatory during the pilot.

Participants

Founder Reviewer

Sales Head

Sales Users in pilot

Ops Reviewer

Product/Admin Owner

CRM Admin if sync issues are material

Weekly Review Agenda

total pilot leads processed

score distribution

confidence distribution

discovery completeness trends

top missing fields

top duplicate or weak questions

top founder overrides

top ops feasibility corrections

notable wins/losses from pilot leads

logic changes to approve for next version

Weekly Output

approved logic updates

training actions for sales users

CRM fixes if needed

list of scenarios to add to test harness

42.10 Lead Handling SOP by Priority Band

High Intent Priority

Sales User: - contact fast within SLA - complete discovery thoroughly - check readiness early

Sales Head: - monitor closely - step in if confidence is low or lead is strategically important

Founder: - review if escalated

Qualified Priority

Sales User: - proceed with standard discovery and proposal path - avoid rushing if critical data missing

Sales Head: - review only if stuck or if lead is large/complex

Nurture / Clarify

Sales User: - focus on missing information - do not move to detailed proposal early

Sales Head: - monitor if lead lingers too long without clarity

Low Priority / Disqualify

Sales User: - re-scope if possible - otherwise mark appropriately

Sales Head: - review only for special strategic exceptions

42.11 Override Handling SOP

When an Override Happens

The responsible reviewer must capture: - what the system said - what was changed - why it was changed - whether the problem was knowledge, scoring, workflow, or UI understanding

Override Categories

service classification correction

scoring correction

feasibility correction

routing correction

proposal-readiness correction

field accuracy correction

Rule

An override is not only an exception. It is a training signal. Every recurring override pattern must be reviewed in weekly logic tuning.

42.12 Proposal Stage Handoff SOP

Before a lead moves to proposal stage, the salesperson must verify: - proposal-readiness status is appropriate - required fields are captured - assumptions are visible - risks are visible - feasibility flags are reviewed if needed

Handoff Package Should Include

requirement summary

confirmed fields

inferred fields

missing but non-blocking fields

score summary

recommended service path

assumptions

risk flags

relevant case studies

This package should be visible to proposal owner or salesperson preparing the proposal.

42.13 CRM Hygiene SOP During Pilot

CRM Admin / Product Admin Must Monitor

duplicate leads

field mismatch between system and CRM

missing mandatory fields after sync

invalid enum values

assignment mismatches

failed tasks or SLA tags

Rule

CRM should remain the operational record, but Entity Brain should remain the decision layer. Neither should silently overwrite the other without auditability.

42.14 Training SOP for Sales Users

Before pilot start, sales users should be trained on: - what the system is trying to do - what confirmed vs inferred means - how to use next-best question suggestions - when to escalate - how to correct fields - how to avoid bypassing the system - how proposal-readiness differs from general interest

Training Format Recommended

one walkthrough session

one scenario-based practice session

one shadow-mode review session

42.15 Pilot Issue Classification SOP

Every issue raised during pilot should be tagged as one of the following: - Knowledge issue - Scoring issue - Question quality issue - CRM sync issue - UI usability issue - Routing issue - Feasibility logic issue - Training issue - Performance/latency issue

This helps avoid vague statements like “the system is not good” and turns feedback into fixable categories.

42.16 Pilot Success Review SOP

At the end of each pilot cycle, leadership should review: - whether founder dependency reduced - whether discovery quality improved - whether high-priority leads were identified earlier - whether feasibility issues were caught earlier - whether sales adopted the system properly - whether logic is stable enough to expand

Expansion Decision Options

expand to more services

expand to customer-facing discovery bot

continue internal-only tuning

pause and fix specific modules before expansion

42.17 Pilot SOP Checklist

Daily Checklist

new pilot leads entered through system

high-priority leads reviewed

pending escalations addressed

sync failures checked

overrides logged

Weekly Checklist

pilot metrics reviewed

top weak questions reviewed

top overrides reviewed

top feasibility corrections reviewed

logic changes approved or deferred

End-of-Pilot Checklist

baseline vs pilot comparison completed

expansion readiness assessed

v2 improvement backlog created

42.18 Recommended Next Document

After this Pilot Operating SOP, the next most useful document is: Figma Wireframe / Prototype Prompt Pack

That will allow AIM to turn this specification into actual screen concepts quickly for design and build alignment.

43. Figma Wireframe / Prototype Prompt Pack

This section converts the AIM Entity Brain product specification into design-ready prompts.

These prompts are intended for: - Figma AI - a product designer - a UI/UX freelancer - low-code UI prototyping tools - internal frontend teams creating first-pass wireframes

Prompt Pack Objective

Generate usable screen concepts for the first version of AIM Entity Brain with: - clean B2B SaaS layout - premium but functional UI - strong information hierarchy - fast decision support for sales and leadership - minimal clutter during live usage

Design Direction

Use a clean, data-driven, premium interface style aligned to AIM’s broader design language: - white or very light backgrounds - dark navy text - AIM blue accents - rounded cards - subtle shadows - clean spacing - high readability - clear chips, tags, and status indicators - dashboard-first layout - modern enterprise SaaS feel

Global UX Principles

Sales must understand a lead in under 30 seconds.

The interface must clearly separate confirmed, inferred, and missing information.

Score, confidence, and proposal-readiness must always be visible.

The UI must support live call usage without forcing too much scrolling.

Important actions must be obvious: ask next question, assign, escalate, override, sync, move to proposal.

AI-generated recommendations must always be visually separable from human-confirmed facts.

43.1 Global Design Prompt

Master Prompt

Design a premium B2B SaaS product called AIM Entity Brain, an AI-powered sales intelligence and discovery copilot for a marketing and activation company. The product helps sales teams qualify leads, ask the right next question, score opportunities, recommend services, identify missing information, and route high-priority leads correctly. The UI should feel modern, clean, premium, and data-driven, with white backgrounds, dark navy typography, AIM-blue accents, rounded cards, light borders, subtle shadows, clean chip-based statuses, and strong information hierarchy. The design must support live sales usage, founder review, and CRM-style workflow. Use a desktop-first layout with modular cards, right-side action panels, sticky score/status areas, and clear separation between confirmed data, inferred data, missing data, recommendations, and risk flags.

43.2 Screen Prompt: Lead Intelligence Dashboard

Prompt

Design a desktop web application screen for Lead Intelligence Dashboard inside AIM Entity Brain. This is the main screen used by sales teams to understand a lead quickly.

The page should include: - top header with lead name, company name, source channel, last updated time, assigned owner - prominent status chips for total lead score, confidence, proposal readiness, SLA priority, escalation flag - left column showing company and contact details, designation, industry, service category, sub-service, geography - central section showing requirement summary, target audience, timeline, budget band, campaign objective, preferred touchpoints - a clear Missing Information card showing unresolved critical fields - a Recommended Next Action card with suggested next step and why it matters - a Solution Recommendation card showing recommended service mix, campaign model, budget band, and top assumptions - a Case Studies / Supporting Proof card - right-side sticky sidebar with score breakdown, confidence explanation, proposal readiness, and quick action buttons - bottom activity timeline with recent interactions, sync events, overrides, and discovery milestones

Use a premium enterprise SaaS style, clean sections, rounded cards, subtle blue highlights, and fast scannability. Make the most important commercial information visible above the fold.

Key UI Elements to Include

score donut or score bar for total lead score

chip-style status labels

collapsible cards for long summaries

quick action buttons: Open Discovery Assistant, Assign Owner, Escalate, Sync CRM, Move to Proposal

visually distinct labels for Confirmed / Inferred / Missing

43.3 Screen Prompt: Live Discovery Assistant

Prompt

Design a desktop screen for Live Discovery Assistant in AIM Entity Brain. This is used by a salesperson during a live call or WhatsApp/email clarification flow.

The screen should feel fast, focused, and minimal-clutter.

The page should include: - left panel showing live transcript or conversation notes - center panel showing Next-Best Question card prominently at the top - below it, a list of alternative questions if needed - a structured answer capture area with editable fields - a Field State Tracker showing confirmed fields, inferred fields, missing critical fields, and recently updated fields - a live Score & Confidence Update panel showing how new answers affect qualification - a Proposal Readiness module that updates live - quick actions to mark answer confirmed, edit field, skip question with reason, request founder review, generate summary - a compact reasoning explanation under the next-best question, like “This question is needed to estimate campaign scope and pricing band.”

Use clean cards, sticky top question area, a strong center-column interaction area, and a right-side intelligence sidebar. The interface should help a salesperson move smoothly without losing conversation flow.

Key UI Elements to Include

“Next Best Question” highlighted in blue-accent card

inline tags showing Quote Critical / Feasibility Critical / Scoring Critical

animated or clearly visible score changes after answer capture

distinct boxes for Confirmed, Inferred, Missing

a top-right “Escalate for Review” button

43.4 Screen Prompt: Founder Review Panel

Prompt

Design a premium review interface for Founder Review Panel in AIM Entity Brain. This screen is used by a founder or sales head to review high-value or low-confidence leads.

The screen should include: - top header with lead identity, company, strategic account badge if applicable, escalation reason - top row of score cards for total score, confidence, strategic value, feasibility, proposal readiness - left section with system-generated lead summary, discovery summary, missing information, and conversation highlights - central section with System Recommendation card showing recommended service mix, next step, assumptions, risks, and suggested owner - right section with Override Controls to edit fields, change service classification, change owner, adjust readiness, or mark nurture/disqualify - a before/after comparison view when override is being entered - override reason input box - override history section showing previous changes, timestamps, and who made them - bottom timeline for recent decisions and review actions

Make the interface feel high-trust, executive, and low-noise. Use premium card layouts, score emphasis, and clear visual distinction between system recommendation and human override.

Key UI Elements to Include

escalation banner at top

split view: System Recommendation vs Override

mandatory override reason field

approve, edit, and override buttons

audit timeline

43.5 Screen Prompt: Solution Recommendation Panel

Prompt

Design a focused screen for Solution Recommendation Panel in AIM Entity Brain. This screen helps sales understand what to propose and why.

The page should include: - primary recommendation card with recommended service mix and campaign model - secondary alternatives card showing 1–2 alternative service paths - “Why this fits” section listing the business reasons for recommendation - “Budget & Timeline Guidance” card with suggested bands - “Assumptions” card and “Exclusions / Risks” card - supporting case studies panel with thumbnails or compact cards - quick actions: Accept Recommendation, Send to Proposal Prep, Compare Alternatives, Escalate

The design should feel strategic and commercially intelligent rather than overly technical. Use elegant cards, concise bullets, strong hierarchy, and premium spacing.

Key UI Elements to Include

recommendation confidence chip

info cards for assumptions and exclusions

linked case-study cards

primary CTA button for moving to proposal stage

43.6 Screen Prompt: Knowledge Admin Panel

Prompt

Design an admin console screen for Knowledge Admin Panel in AIM Entity Brain. This panel is used to manage services, industry playbooks, discovery questions, scoring config, case studies, and logic versions.

The page should include: - left navigation for Services, Industries, Questions, Scoring, Case Studies, Versions - main content area showing a table or card list of the selected knowledge object - edit drawer or side panel for updating records - status chips for Active, Draft, Archived, Needs Review - version management controls for publish and rollback - filters for service, industry, status, and owner - a top banner showing current live logic version

The design should feel like a modern internal admin SaaS panel: clean, organized, and efficient.

Key UI Elements to Include

searchable data tables

side-edit panel or modal

publish version button

rollback button

structured field forms

43.7 Screen Prompt: Weekly Pilot Analytics Dashboard

Prompt

Design a desktop analytics dashboard for AIM Entity Brain Pilot Review. This dashboard is used weekly by founder, sales head, and product/admin to assess pilot quality.

The page should include: - KPI cards for leads processed, average completeness score, duplicate question rate, override count, sync failure count, proposal-ready rate - charts for score distribution, confidence distribution, lead status distribution - a panel for top missing fields - a panel for top override categories - a panel for top weak questions or repeated question problems - a panel for conversion by score band - a table of high-risk pilot issues - a weekly action recommendation section

Use a premium analytics UI, clean charts, white background, dark text, restrained AIM-blue accents, rounded metric cards, and highly readable tables.

43.8 Low-Fidelity Wireframe Prompt Pack

Use these prompts when you want simple structural wireframes instead of polished UI.

Low-Fidelity Master Prompt

Create grayscale, low-fidelity wireframes for a B2B SaaS sales intelligence product called AIM Entity Brain. Focus on layout, information hierarchy, and workflow usability rather than visual polish. Use boxes, placeholders, labels, tables, cards, sidebars, tabs, and chips. Show desktop-first screen layouts for lead intelligence, live discovery, founder review, recommendation, and knowledge admin.

Low-Fidelity Screen Prompt: Lead Dashboard

Create a grayscale wireframe for a lead dashboard with a three-column layout: left for lead identity and company info, center for requirement summary and missing info, right for score, confidence, readiness, and action buttons. Include an activity timeline below.

Low-Fidelity Screen Prompt: Live Discovery Assistant

Create a grayscale wireframe for a live discovery screen with left transcript panel, center next-best question and answer capture area, and right field-state tracker with live score changes.

Low-Fidelity Screen Prompt: Founder Review

Create a grayscale wireframe for a founder review screen with escalation banner, summary area, system recommendation panel, override form, and audit timeline.

43.9 Clickable Prototype Flow Prompt

Prompt

Create a clickable prototype for AIM Entity Brain with the following flow: 1. user lands on Lead Intelligence Dashboard 2. clicks Open Discovery Assistant 3. sees next-best question and enters an answer 4. score and readiness update dynamically 5. user returns to dashboard and sees updated summary 6. user opens Solution Recommendation Panel 7. user chooses Escalate for Review 8. founder review screen opens with override controls 9. founder changes service path and submits override 10. dashboard updates with new recommendation and audit entry

The prototype should prioritize business workflow clarity over full UI polish.

43.10 Component Library Prompt

Prompt

Design a component library for AIM Entity Brain using a premium B2B SaaS design system. Include: - status chips - score cards - confidence indicators - summary cards - missing info alerts - field state badges for Confirmed / Inferred / Missing - side panels - activity timeline rows - editable table rows - recommendation cards - escalation banner - override modal - analytics KPI cards

Use consistent rounded corners, subtle shadows, navy typography, blue accents, clean grids, and high readability.

43.11 UX Copy Guidance for Prototype

Use short, professional labels and helpful assistant-style system text.

Suggested Label Examples

Lead Intelligence

Discovery in Progress

Recommended Next Step

Missing Critical Information

Proposal Readiness

High Intent Priority

Needs Human Review

Confirmed Information

Inferred Information

Escalation Reason

Recommended Service Mix

Why This Fits

Risks & Assumptions

Suggested Helper Text Examples

This question helps determine campaign scope and budget fit.

More information is needed before a scoped proposal can be prepared.

This lead is high-value, but confidence is low due to missing commercial details.

Feasibility should be validated before final commitment.

43.12 Recommended Prototype Build Order

Create design concepts in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel 6. Weekly Pilot Analytics Dashboard

This sequence matches the highest-value usage path for AIM.

43.13 Recommended Next Deliverables

After this prompt pack, the next strongest execution outputs are: 1. a Figma file or clickable prototype 2. an engineering estimation sheet by workstream 3. a knowledge ingestion tracker spreadsheet 4. a pilot-ready issue tracker template

At this point, AIM has enough specification depth to begin design, estimation, and phased build execution.

44. Knowledge Ingestion Operating Model

This section turns knowledge ingestion from a concept into a working operating model for AIM.

The goal is to make sure AIM can continuously convert: - founder knowledge - service know-how - case studies - proposals - SOWs - ops constraints - sales conversations - objections and rebuttals

into structured, versioned, usable Entity Brain knowledge.

Operating Model Principles

Ingestion is a recurring business process, not a one-time upload project.

Every important knowledge item should move through a defined workflow.

Nothing should become live without validation.

Every structured record must retain source provenance.

High-frequency commercial knowledge should be ingested first.

44.1 Knowledge Ingestion Workflow

Stage 1: Capture

Collect raw knowledge from founders, sales, ops, proposals, decks, and transcripts.

Stage 2: Inventory

List and tag the source with metadata.

Stage 3: Extract

Pull out commercially meaningful facts, patterns, conditions, and rules.

Stage 4: Normalize

Convert extracted points into structured entities.

Stage 5: Validate

Get service owner / founder / ops approval.

Stage 6: Publish

Push validated logic into active or draft knowledge version.

Stage 7: Monitor

Track where the ingested knowledge performs well or poorly in live usage.

Stage 8: Refresh

Update or retire stale knowledge.

44.2 Recommended Knowledge Repositories

AIM should maintain four distinct knowledge repositories.

Repository A: Structured Core Knowledge

Stores: - services - sub-services - discovery questions - scoring rules - routing rules - feasibility notes - objections - proposal modules

Repository B: Retrieval Knowledge

Stores: - case studies - decks - SOWs - proposal archives - transcripts - internal playbooks

Repository C: Working Draft Knowledge

Stores: - extracted but unvalidated records - founder interview notes - pending logic proposals - staging-only updates

Repository D: Historical / Archived Knowledge

Stores: - old logic versions - retired services - outdated pricing patterns - historical references

44.3 AIM-Specific Knowledge Domains to Ingest

Domain 1: Commercial Service Knowledge

what AIM sells

where each service fits

where it does not fit

what is required before quote

what is required before feasibility validation

Domain 2: Touchpoint Intelligence

IT parks

RWAs / apartments

malls

retail stores

colleges

gyms

LED vans

hybrid combinations

Domain 3: Industry Intelligence

FMCG

snacks / foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care

Domain 4: Sales Discovery Intelligence

must-ask questions

disqualifying signals

upsell signals

pilot vs rollout signals

budget discovery patterns

Domain 5: Delivery / Ops Intelligence

permissions

lead times

staffing assumptions

fabrication dependencies

city-level constraints

reporting realities

Domain 6: Case Study and Proof Intelligence

what proof to use for which lead

which results matter by category

what kind of case study helps which objection

Domain 7: Objection and Rebuttal Intelligence

budget objections

trust objections

timing objections

attribution objections

feasibility objections

“why this touchpoint” objections

44.4 Knowledge Item Types

Each ingested item should be classified into one of these types.

44.5 Detailed Source Inventory Template

Use this structure for every potential source.

44.6 Extraction Template by Source

When extracting from any source, capture the following.

44.7 Normalization Templates

A. Service Logic Normalization Template

service_name

sub_service_name

description

ideal_use_cases

non_ideal_use_cases

best_fit_industries

best_fit_audiences

44.8 Knowledge Validation Workflow

Validation Levels

Level 1: Content Validation

Checks whether the extracted content is understandable and correctly structured. Owner: Product/Admin

Level 2: Commercial Validation

Checks whether the logic matches real sales and founder thinking. Owner: Founder / Sales Head

Level 3: Feasibility Validation

Checks whether the guidance is operationally realistic. Owner: Ops Lead

Level 4: Publication Validation

Checks whether the item is ready for live logic versioning. Owner: Product/Admin + designated approver

Validation Status Options

Draft

Needs Commercial Review

Needs Feasibility Review

Approved for Staging

Approved for Live

Rejected

Archived

44.9 Knowledge Review SLAs

To prevent ingestion backlog from piling up, use practical turnaround targets.

44.10 AIM Knowledge Backlog Structure

AIM should maintain the ingestion backlog in four buckets.

Bucket A: Pilot-Critical Now

Needed before or during pilot.

Bucket B: High-Value Next

Strong value but not needed on day one.

Bucket C: Expansion Later

Useful for broader product scale after pilot stability.

Bucket D: Historical / Research

Useful for reference but not urgent to normalize.

44.11 Recommended AIM Pilot Knowledge Backlog

Bucket A: Pilot-Critical Now

Product Sampling — core definition

IT Park Sampling logic

RWA / Apartment Sampling logic

Mall Sampling logic

In-Store Sampling logic

Brand Activation — kiosk / demo logic

LED Van campaign logic

Top 5 beauty/skincare case studies

Top 5 FMCG/snack/beverage case studies

Top budget objections and responses

Top feasibility blockers by service

Founder scoring/routing signals for high-value leads

Bucket B: High-Value Next

Retail branding

Hybrid campaign solution logic

College sampling expansion

Gym / fitness outreach expansion

Menstrual hygiene campaign nuances

Pet care targeting logic

Additional case study tagging

Bucket C: Expansion Later

voice-call transcript intelligence

email thread mining

long-term win/loss patterns

advanced proposal-block recommendations

Bucket D: Historical / Research

old proposals with outdated pricing

one-off client exception SOWs

historical services no longer central to AIM

44.12 AIM First 25 Knowledge Tasks

Below is a practical starter backlog.

44.13 Founder Interview Pack for Ingestion

Use this structured format when capturing founder knowledge.

Founder Interview Questions by Service

When is this service the best fit?

When is this service a weak fit?

What are the first three questions you ask?

What information must you know before quoting?

What makes you cautious about this type of lead?

What signals tell you the lead is serious?

What common mistakes do salespeople make with this service?

What objections come up most often?

What is the best fallback or pilot option when scope is unclear?

Which case study do you usually reference and why?

Output from Each Interview

service rules

discovery questions

scoring signals

objection-response pairs

case study mapping

feasibility warnings

44.14 Sales Debrief Capture Format

Sales users should log structured insights after important calls.

Capture Fields

lead_id

service discussed

what questions worked well

where the prospect got confused

what objection came up

what information was hard to get

what the system got right

what the system got wrong

whether founder help was needed

recommendation for logic update

This is one of the best sources for real-world ingestion improvement.

44.15 Ops Debrief Capture Format

Ops should contribute not only when something fails, but as a proactive ingestion source.

Capture Fields

service / touchpoint

what feasibility assumption was unrealistic

what information sales missed

what timeline assumptions were wrong

what permission dependency was critical

what product handling concern existed

what future question should be asked earlier

44.16 Knowledge Freshness and Retirement Rules

A knowledge item should be marked “Needs Review” when:

pricing drivers change materially

permissions reality changes

a service definition changes

repeated overrides challenge the same rule

a case study becomes outdated or less relevant

A knowledge item should be archived when:

service is no longer actively sold

case study is no longer commercially useful

logic is replaced by a better version

pricing assumptions are obsolete and misleading

44.17 Knowledge Quality Scorecard

Each ingested knowledge item can be rated before publication.

Suggested Publication Rule

Only items with acceptable ratings across all core dimensions should move live.

44.18 Knowledge Ingestion Cadence Recommendation

Daily

capture new important insights from sales and ops

tag new useful source materials

Weekly

normalize priority items

review overrides and convert them into candidate logic updates

publish approved micro-updates if safe

Monthly

review service logic freshness

review question-bank effectiveness

archive stale knowledge

refresh case study relevance

44.19 Knowledge Ops Ownership Model

If AIM wants this system to stay strong, one person should effectively own knowledge operations.

Recommended Knowledge Ops Owner Responsibilities

maintain source inventory

coordinate extraction and normalization

chase reviews and approvals

ensure freshness and archive stale logic

prepare weekly knowledge update recommendations

track ingestion throughput and bottlenecks

This role can initially be handled by Product/Admin.

44.20 Recommended First Working Session Agenda

For AIM’s first hands-on knowledge ingestion workshop, run this agenda:

Session 1: Product Sampling Core (90–120 min)

define Product Sampling v1

define IT Park, RWA, Mall, In-Store variants

list quote-critical inputs by variant

list feasibility-critical inputs by variant

list top objections by variant

list strongest case studies by variant

approve draft discovery questions

Session 2: Activation + LED Van (60–90 min)

define kiosk activation logic

define product demo logic

define LED van logic

list misfit cases

approve scoring cues and escalation signals

Session 3: Industry Plays (60–90 min)

beauty/skincare

FMCG/snacks/beverages

wellness

baby care / menstrual hygiene where relevant

44.21 Recommended Next Output

The best practical next artifact after this operating model is: a Knowledge Ingestion Tracker with columns, statuses, owners, and the first AIM backlog pre-filled

That will convert this plan into an actual working tool for the team.

45. Service-by-Service Ingestion Pack

This section provides the actual ingestion packs AIM can use service by service.

Each pack is designed to help AIM move from raw founder knowledge and past documents into: - structured service records - discovery question banks - feasibility notes - objection-response pairs - case-study tags - proposal modules - scoring signals

How to Use This Section

For each service pack: 1. review the service definition internally 2. gather the recommended source materials 3. run founder / sales / ops capture session 4. normalize outputs into structured records 5. validate the pack before publishing it into the live knowledge version

Standard Pack Structure

Each service pack includes: - service purpose - what the Entity Brain must know - source materials to collect - founder capture prompts - sales capture prompts - ops capture prompts - structured entities to create - validation checklist - publication readiness checklist

45.1 Pack 1 — Product Sampling (Core)

Service Purpose

This is the parent commercial service. It defines AIM’s overall product sampling capability, where trial-based brand outreach is used to drive awareness, first use, consideration, and in some cases conversion or measurable response.

What the Entity Brain Must Know

what product sampling means in AIM’s context

what business objectives product sampling solves

which industries are best suited

which touchpoints are available under product sampling

where sampling is a weak fit

what must be known before quoting

what must be known before confirming feasibility

what proof/case studies to show by industry or touchpoint

Recommended Source Materials

AIM sampling service decks

founder explanations of sampling model

past sampling proposals and SOWs

sample budgets or cost breakups

case studies from beauty, FMCG, wellness, beverage, baby care, etc.

past client requirement notes

WhatsApp/email threads where sampling approach was explained

Founder Capture Prompts

In AIM terms, what exactly counts as product sampling and what does not?

When do you immediately know sampling is the right recommendation?

When do you avoid recommending sampling?

What are the top 5 questions you ask first?

What do you need before giving even a budgetary estimate?

Which touchpoints do you mentally shortlist first by category?

What makes a product sampling brief weak or risky?

What kind of client expectation usually creates trouble later?

Sales Capture Prompts

What type of brands ask for sampling most often?

What information do prospects most often fail to provide?

Which objections come up early most often?

What questions usually open up a better conversation?

Where do you most often need founder help today?

Ops Capture Prompts

What are the most common feasibility blockers in sampling?

Which handling or permission issues are often missed by sales?

What lead-time assumptions are most often unrealistic?

What reporting expectations should be carefully managed?

Structured Entities to Create

Product Sampling service record

parent discovery question set

universal quote-critical input set

universal feasibility-critical input set

universal sampling objections set

universal sampling scoring cues

touchpoint decision matrix

case-study map by industry and objective

Validation Checklist

service definition is clear and non-generic

best-fit industries are captured

clear misfit logic exists

all child touchpoints are referenced consistently

quote-critical inputs are complete but not excessive

feasibility notes reflect real delivery constraints

Publication Readiness Checklist

parent service record approved

universal sampling question bank approved

top 3 case studies tagged

pilot scoring cues approved

founder escalation signals approved

45.2 Pack 2 — IT Park Sampling

Service Purpose

Sampling executed in office parks, tech parks, or workplace clusters to reach working professionals and employee audiences.

What the Entity Brain Must Know

who this touchpoint is best for

when IT parks outperform malls or RWAs

premium vs volume-focused park choices

kiosk vs promoter-led distribution options

branding dependencies

employee audience fit by category

permission and access realities

Ideal Use Cases

beauty / skincare targeting working professionals

beverages and wellness products for office-going consumers

premium FMCG trial among salaried urban audience

product education in controlled weekday environments

Common Misfit Cases

products with no working-professional relevance

very low sample quantity requests where park access effort is too high

brands demanding very broad general household reach

extremely urgent campaigns with no time for park approvals/access coordination

Recommended Source Materials

past IT park proposals

lists of past venue types or corporate parks used

photos / proof of previous activations

staffing notes

permission notes and timelines

case studies with office-going TG

Founder Capture Prompts

When do you choose IT parks over malls or apartments?

What kind of products work best here?

How do you distinguish premium parks vs high-volume parks?

What does the client need to clarify before pricing is meaningful?

What usually gets underestimated in this touchpoint?

Sales Capture Prompts

What target-audience descriptions signal a strong IT park fit?

What questions help reveal whether the client wants interaction or only distribution?

What confusion do prospects typically have about office park access or quality of audience?

Ops Capture Prompts

How much lead time is typically needed?

What permissions or coordination models commonly apply?

What branding / setup limitations exist on site?

What manpower assumptions are realistic?

Structured Entities to Create

IT Park Sampling sub-service record

quote-critical question set

feasibility note set

premium-vs-volume venue assumptions guide

objections specific to workplace outreach

beauty/wellness/FMCG case-study tag group

Validation Checklist

working-professional TG logic is explicit

premium / scale differentiation is captured

permission model is described accurately

site setup options are clearly defined

Publication Readiness Checklist

one premium audience case study tagged

one volume-focused case study tagged

founder-approved must-ask questions loaded

feasibility notes validated by ops

45.3 Pack 3 — RWA / Apartment Sampling

Service Purpose

Sampling conducted in residential communities, apartment complexes, or gated societies to reach households and family decision-makers.

What the Entity Brain Must Know

which household-oriented categories fit best

how to distinguish premium apartments vs broad family communities

gate activity vs kiosk vs deeper engagement formats

society permissions reality

household decision-maker targeting logic

where residential outreach is a poor fit

Ideal Use Cases

baby care

household FMCG

family-use personal care products

food trial for family or community consumption

products where homemakers / parents / households matter

Common Misfit Cases

youth-only products with weak household relevance

categories better suited to workplace or college contexts

campaigns with no tolerance for society approvals or timing limits

premium niche categories that need a more controlled aspirational environment

Recommended Source Materials

apartment activation proposals

pricing sheets by society count or manpower model

permission notes

earlier residential campaign proofs

community-wise targeting notes if available

Founder Capture Prompts

What are the strongest buying situations for RWA sampling?

What signals tell you a client actually needs residential reach rather than mall or retail reach?

What are the first three things you ask about scale and society profile?

When do you reject or redirect the lead?

Sales Capture Prompts

What do prospects usually misunderstand about RWA execution?

What info is usually missing when they ask for pricing?

Which objections or hesitations come up most often?

Ops Capture Prompts

What permission models differ across apartments?

What timing rules or society restrictions are common?

What staffing assumptions or transport considerations matter?

Structured Entities to Create

RWA / Apartment Sampling sub-service record

society-type segmentation notes

quote-critical questions by residential model

permission dependency notes

household-relevance scoring cues

objections around permissions / community access / value perception

Validation Checklist

household TG logic is strong

premium vs broad-community distinction is captured

permission issues are realistic

scale planning logic is usable for quoting

Publication Readiness Checklist

at least 2 residential campaign examples tagged

key objections and responses approved

risk notes validated by ops

45.4 Pack 4 — Mall Sampling / Mall Activation

Service Purpose

Sampling or trial activity inside malls or public premium venues, often supported by kiosk, promoter interaction, or branded setup.

What the Entity Brain Must Know

when mall activation is worth recommending

premium-mall vs high-footfall-mall logic

kiosk vs promoter-only formats

branding/fabrication impact on cost and feasibility

demo-led vs handout-led differences

weekend vs weekday considerations

Ideal Use Cases

beauty / skincare

premium personal care

beverage, food, and new launches needing mass trial

products benefitting from visible public engagement

brands wanting premium perception plus reach

Common Misfit Cases

very low budgets for premium venues

products with no shopper interaction value

client not ready for branding/fabrication cost implications

B2B products with poor consumer venue relevance

Recommended Source Materials

mall activation proposals

fabrication cost sheets

mall permission notes

staffing models

photos and case studies

existing premium-vs-footfall venue notes

Founder Capture Prompts

When do you recommend mall before IT park or retail?

How do you distinguish premium need vs simple volume need?

What is the minimum information needed before pricing?

When do branding requirements materially change the solution?

Sales Capture Prompts

What do prospects usually ask first about malls?

What do they misunderstand about cost drivers?

Which questions help uncover whether a kiosk is really needed?

Ops Capture Prompts

What permissions, setup, or power needs matter most?

What fabrication turnarounds are realistic?

What site constraints affect demo-led activity?

Structured Entities to Create

Mall Sampling / Activation sub-service record

venue-tier logic notes

kiosk-vs-promoter scope rules

branding/fabrication cost driver notes

weekend/weekday planning assumptions

mall-specific objections and responses

Validation Checklist

venue tier logic is explicit

cost drivers are accurately captured

kiosk vs promoter-only differentiation is clear

demo/compliance concerns are noted where relevant

Publication Readiness Checklist

one premium mall case study tagged

one broad-footfall mall example tagged

fabrication notes validated by ops

45.5 Pack 5 — In-Store / Retail Sampling

Service Purpose

Sampling or product trial executed inside retail stores to influence shopper conversion, product education, and sell-out.

What the Entity Brain Must Know

when in-store is stronger than mall or residential

retailer / chain approval dependence

store count and chain specifics as cost drivers

demo / educate / distribute staffing differences

shelf / in-store conversion use case

store-level reporting expectations

Ideal Use Cases

launch support in modern trade or chain stores

sell-out push

shopper education for new or unfamiliar products

categories where point-of-purchase trial matters strongly

Common Misfit Cases

no retailer tie-up or unclear store access

no list of stores or chain context

client expects instant conversion attribution without retail control

extremely low store count with disproportionate approval effort

Recommended Source Materials

retail sampling proposals

store-level campaign reports

retailer-specific notes if available

approval dependencies

promoter training notes

case studies from retail chain activations

Founder Capture Prompts

When is in-store the right answer instead of mall or IT parks?

What do you need to know before even giving an initial estimate?

How do you judge whether the client has real retail access?

What kinds of products benefit most from in-store demo or education?

Sales Capture Prompts

What questions reveal whether retailer approval is real or assumed?

What common confusion exists between in-store branding and in-store sampling?

What are the most common client goals here: sell-out, awareness, education?

Ops Capture Prompts

What data is required from stores before execution?

What installation/demo rules matter on ground?

How do staffing/training assumptions change by category?

Structured Entities to Create

In-Store / Retail Sampling sub-service record

retailer approval logic notes

quote-critical question set by chain/store scenario

training-level / promoter-role notes

store-count pricing drivers

retail-specific objections and proof assets

Validation Checklist

store access dependency is explicit

conversion vs education objective split is clear

retailer-approval logic is realistic

staffing differences are captured

Publication Readiness Checklist

one retail-chain case study tagged

store/chain logic validated by sales and ops

must-ask questions approved

45.6 Pack 6 — Kiosk-Based Brand Activation / Product Demo Booth

Service Purpose

Interactive branded activation designed to attract attention, engage audiences, demonstrate the product, and support trial or education.

What the Entity Brain Must Know

when simple sampling should become a fuller activation

kiosk vs light branded setup vs promoter-only model

demo-led vs gamified vs engagement-led activation

branding/fabrication requirements

staff/training expectations

venue-space and power requirements

Ideal Use Cases

product launches needing interaction

categories requiring demonstration or education

premium public or retail environments

campaigns aiming for stronger recall than handout-only distribution

Common Misfit Cases

clients wanting only passive visibility with no interaction

no tolerance for fabrication or branding budget

very small-scale brief where a kiosk is overkill

categories with heavy demo/compliance restrictions not yet thought through

Recommended Source Materials

kiosk activation proposals

demo booth budgets

fabrication vendor templates

staff role descriptions

game / engagement format notes

execution photos and case studies

Founder Capture Prompts

What makes you move from sampling to activation?

What signs tell you the client needs engagement, not just distribution?

What are the most common activation formats AIM should standardize?

When does the kiosk become too heavy or unnecessary for the brief?

Sales Capture Prompts

What client words or goals signal this is really an activation brief?

What discovery questions help uncover branding or engagement expectations?

Which client misunderstandings about cost and complexity are most common?

Ops Capture Prompts

What setup requirements matter most on site?

What dependencies exist around fabrication, power, storage, transport, staff training?

What kind of lead times are realistic by venue type?

Structured Entities to Create

Kiosk Activation sub-service record

demo / gamification / education decision notes

branding/fabrication module rules

venue dependency notes

activation-specific objections and responses

proposal modules for kiosk scope variants

Validation Checklist

activation-vs-sampling distinction is clear

heavier-scope dependencies are captured

staffing and training assumptions are usable

venue dependency notes are grounded

Publication Readiness Checklist

at least 2 activation case studies tagged

fabrication module logic approved

ops risk notes reviewed

45.7 Pack 7 — LED Van / Mobile Outreach

Service Purpose

Vehicle-led mobile visibility or route-based campaign used for awareness, launch buzz, route coverage, or branch/hotspot-based exposure.

What the Entity Brain Must Know

when LED van solves the client’s objective and when it does not

route-based awareness logic

duration, city, and vehicle-type cost drivers

permissions and operating-hour realities

route planning needs

whether client wants visibility only or additional support like audio/promoter/branding

Ideal Use Cases

city-wide visibility bursts

launch buzz

route-specific awareness around branches, hotspots, events, or neighborhoods

quick reach-focused campaigns where awareness is the main job

Common Misfit Cases

clients expecting direct measurable conversion without support layers

no clarity on route, city, or duration

unrealistic immediate deployment when vehicle availability is constrained

clients needing deep interaction instead of visibility

Recommended Source Materials

LED van proposals

city-wise rate cards or budgets

route planning notes

vehicle availability notes

permission notes

photos / video proofs

Founder Capture Prompts

When do you recommend LED van over static media or on-ground activation?

What are the main commercial drivers for pricing and recommendation?

What is commonly misunderstood by clients about this format?

When should the lead be re-scoped because expectation is wrong?

Sales Capture Prompts

Which questions expose whether the client wants awareness or performance?

What do clients often fail to provide about routes, days, and city needs?

What objections usually come up around cost or utility?

Ops Capture Prompts

What availability and permission realities differ by city?

What are the standard operating assumptions around kilometers, hours, driver, fuel, tolls?

What lead-time caveats matter most?

Structured Entities to Create

LED Van / Mobile Outreach sub-service record

city / duration / route cost driver set

awareness-fit scoring cues

expectation-mismatch objection library

route planning note set

ops assumptions record by city where possible

Validation Checklist

route/visibility logic is clear

performance-vs-awareness expectation issue is captured

city-specific feasibility notes exist where possible

standard operating assumptions are explicit

Publication Readiness Checklist

at least 1 Bangalore and 1 Hyderabad example or note set if available

cost-driver structure approved

sales must-ask questions approved

45.8 Cross-Pack Standard Output Checklist

For every service pack before publication, AIM should have these minimum outputs: - 1 approved service record - 1 approved discovery question set - 1 approved quote-critical input list - 1 approved feasibility-critical input list - 1 approved risk / constraint note set - 1 approved objections-and-response set - 1 approved scoring cue set - at least 1 case study tagged, ideally 2+ - founder reviewer sign-off - ops sign-off if execution-sensitive

45.9 Cross-Pack Working Session Format

Session Format per Service

Duration: 45–75 minutes per service pack

Suggested Agenda

define the service in AIM terms

identify best-fit vs weak-fit use cases

finalize mandatory discovery questions

finalize quote-critical fields

finalize feasibility-critical fields

capture common objections

shortlist proof/case studies

note the top risk patterns

define escalation situations

approve draft structured records

45.10 Recommended Working Sequence for AIM

Use this order for the first ingestion cycle: 1. Product Sampling (Core) 2. IT Park Sampling 3. RWA / Apartment Sampling 4. Mall Sampling 5. In-Store / Retail Sampling 6. Kiosk Activation 7. LED Van / Mobile Outreach

This sequence matches the highest-value pilot logic already defined.

45.11 Recommended Next Artifact

After this service-by-service pack, the best next artifact is: a filled Knowledge Ingestion Tracker with these service packs broken into actionable rows, owners, and due dates

That will let AIM immediately begin execution service by service.

46. Filled Service-Record Pack — Product Sampling (Core)

This section provides the first fully filled service-record pack for AIM Entity Brain.

It is written in a format that can be directly used by: - Product/Admin during ingestion - founders during validation - engineering while shaping the knowledge schema - sales while understanding what the system should know

This is the parent service record for Product Sampling. Sub-services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

46.1 Service Record Header

46.2 Service Definition

Working Definition

Product Sampling is AIM’s controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

46.3 Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following: - product trial - awareness through physical experience - new product launch support - target-group-specific introduction - category education - sell-out assistance in supported environments - feedback collection after trial - trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

46.4 Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

46.5 Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

46.6 Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

46.7 Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

46.8 Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known: - product category - target audience - geography - timeline band - sample volume or scale band - preferred touchpoint or touchpoint recommendation path - campaign model (pilot / rollout) - budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

46.9 Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following: - permission dependency by chosen touchpoint - product handling requirements - temperature / tasting / demo constraints if any - timeline realism - promoter/staffing need - branding/setup scope if applicable - city-level ops availability - reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

46.10 Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by: - touchpoint type - city and geography spread - sample volume - campaign duration - promoter/manpower need - setup / kiosk / branding requirement - permissions dependency - reporting complexity - handling complexity of sample product - campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

46.11 Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

46.12 Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

46.13 Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say: - “Product Sampling is a strong parent fit.” - then recommend child path(s) with reason - then show assumptions and missing inputs before final scoping

46.14 Risk Flags

The system should explicitly warn when: - product category and venue appear mismatched - target audience is too broad for current scope - timeline may not support permissions or setup - scale is too low for chosen touchpoint economics - attribution expectations exceed planned campaign design - sample handling requirements are still unclear

46.15 Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by: - industry - objective - touchpoint - geography - audience type - scale band - reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

46.17 Validation Checklist — Filled

46.18 Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following: 1. founder review and wording approval 2. sales-head review of objections and discovery questions 3. ops validation of feasibility risks and handling constraints 4. case-study mapping for at least 3 strong parent references 5. confirmation of child-service inheritance model in knowledge schema 6. approval of parent scoring cues and escalation triggers

46.19 Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is: IT Park Sampling

Reason: - it is one of AIM’s highest-value sampling variants - it frequently needs nuanced founder judgment - it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM’s targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

19. Suggested JSON Shape

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Cross-Industry Recommendation Rules + Industry-to-Service Ranking Matrix

1. Document Purpose

This document defines the cross-industry recommendation layer for AIM Entity Brain.

Its purpose is to help the system answer one of the most important commercial questions consistently:

Given the industry, objective, audience, budget, timeline, and context, which AIM service should be recommended first, which should be recommended second, and which should be avoided?

This document is meant to sit above:

individual service records

individual industry playbooks

It acts as the decision bridge between them.

2. Why This Layer Matters

If the Entity Brain only knows:

what each service is, and

what each industry generally prefers,

that is still not enough.

It must also know:

when to prioritize precision over scale

when to prioritize trust over reach

when to prioritize conversion context over visibility

when to recommend pilot-first instead of rollout-first

when one service is the primary fit and another is only a secondary option

Without this layer, the system may produce flat recommendations instead of founder-like recommendations.

3. Recommendation Design Principles

Industry fit alone is not enough. Objective and audience context must refine the choice.

Service ranking should be conditional, not absolute.

Primary recommendation should solve the main business job.

Secondary recommendation should exist only if it meaningfully improves fit.

The system should clearly separate core fit from optional expansion paths.

Misfit logic should suppress attractive-but-wrong options.

If the environment can damage brand fit, that should override scale temptation.

4. Recommendation Output Model

For any qualified lead, the system should produce:

4.1 Primary Recommendation

The best current commercial path.

4.2 Secondary Recommendation

A viable alternative if:

budget is different

timeline is different

client preference shifts

feasibility weakens for the primary path

4.3 Optional Expansion Path

Only shown when:

hybrid campaign makes sense

phased rollout is sensible

a pilot-first followed by scale path is commercially strong

4.4 Suppressed Options

The system should internally mark low-fit options as:

weak fit

avoid unless client insists

misfit

5. Cross-Industry Service Ranking Scale

Use the following recommendation strength labels.

6. AIM Service Set Used in This Matrix

The matrix uses the following service options:

IT Park Sampling

RWA / Apartment Sampling

Mall Sampling / Mall Activation

In-Store / Retail Sampling

College / Campus Sampling

Gym / Fitness Sampling

Kiosk-Based Brand Activation / Product Demo Booth

LED Van / Mobile Outreach

Hybrid Campaign Solution

7. Industry-to-Service Ranking Matrix

7.1 Beauty / Skincare

Default Recommendation Bias

prioritize audience quality over raw trial volume

suppress low-context mass distribution for premium briefs

7.2 FMCG / Snacks / Beverages

Default Recommendation Bias

prioritize usage-context fit + scalable reach

handling/logistics can promote or demote a touchpoint sharply

7.3 Wellness / Nutrition

Default Recommendation Bias

prioritize credibility of environment and affinity of audience

only scale after context fit is established

7.4 Baby Care

Default Recommendation Bias

prioritize trust-first environments over pure reach

suppress loud, generic, or low-relevance public distribution

7.5 Menstrual Hygiene

Default Recommendation Bias

prioritize comfort, relevance, and education fit over broad reach

suppress any touchpoint likely to create awkward engagement dynamics

7.6 Pet Care

Default Recommendation Bias

prioritize actual pet-owner density over general reach

avoid broad non-owner distribution

8. Cross-Industry Meta Rules

8.1 Objective-to-Service Rules

If the primary objective is Product Trial

Bias toward:

Product Sampling environments first

then activation only if explanation/experience is necessary

If the primary objective is Education

Bias toward:

Kiosk-Based Activation / Demo Booth

In-Store / Retail Sampling

guided workplace / campus / controlled environments

If the primary objective is Sell-Out Support

Bias toward:

In-Store / Retail Sampling first

then supporting awareness or trial formats second

If the primary objective is Premium Visibility + Trial

Bias toward:

Mall Sampling / Mall Activation

Kiosk-Based Activation

then IT Park if premium audience precision matters more than public visibility

If the primary objective is Awareness / Launch Buzz

Bias toward:

Mall/public visibility

LED Van / Mobile Outreach

activation formats

sampling only if trial is part of the actual objective

8.2 Audience-to-Service Rules

Working Professionals

Prefer:

IT Park Sampling

IT Park + selective premium mall hybrid

workplace-led activation

Households / Parents / Family Consumers

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

selective family-footfall mall activation

Shoppers Near Purchase Context

Prefer:

In-Store / Retail Sampling

retail + demo activation

mall only if purchase-context access is weak but trial still valuable

Students / Youth

Prefer:

College / Campus Sampling

college + activation hybrid

mall only if youth public context is more commercially relevant than campus

Fitness / Wellness Users

Prefer:

Gym / Fitness Sampling

Gym + workplace hybrid

premium mall/public demo only if visibility matters alongside trial

Premium Public Audience

Prefer:

Mall Sampling / Mall Activation

Kiosk-Based Activation

selective IT Park if public visibility is less important than audience quality

8.3 Environment-Sensitivity Rules

High Environment Sensitivity Categories

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

premium Pet Care

Rule

For these categories, environment fit should carry extra recommendation weight.

The system should demote any touchpoint that is operationally possible but brand-wise weak.

8.4 Trust-Sensitivity Rules

High Trust-Sensitivity Categories

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule

When trust sensitivity is high:

prefer controlled, relevant environments

prefer trained promoter / guided interaction where appropriate

suppress low-context scale-first paths unless the brand explicitly prefers them

8.5 Scale-First vs Precision-First Rules

Default Precision-First Industries

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

Default Scale-First Industries

FMCG / Snacks / Beverages

Rule

If a scale-first industry has specialized handling or a niche audience, temporarily treat it like a precision-first brief.

If a precision-first industry has broader mass orientation and low environment sensitivity, allow controlled scale expansion.

9. Recommendation Tie-Breaker Rules

When two services look viable, use this tie-breaker order:

Audience relevance

Environment credibility / brand fit

Objective fit

Feasibility realism

Budget alignment

Case-study support availability

Speed to deploy

Example

If both Mall Sampling and IT Park Sampling are viable for a premium skincare brand targeting women professionals:

choose IT Park first if audience precision matters more

choose Mall first if public brand visibility is equally important

10. Pilot-First Recommendation Rules

The system should recommend pilot-first when:

the client is exploring a new touchpoint

the category is premium or trust-sensitive

audience quality matters more than raw volume

the brief is strategically important but still unclear

the product has handling or explanation complexity

the client wants measurable proof before scale

Pilot-First Output Language

“A pilot-first approach may be appropriate before broader rollout.”

“We recommend validating audience response in one city / one touchpoint first.”

“This touchpoint looks promising, but a controlled phase 1 will likely improve learning and reduce waste.”

11. Hybrid Campaign Recommendation Rules

The system should recommend Hybrid Campaign Solution only when one of the following is true:

the brief genuinely spans multiple distinct audiences

the objective requires both trial and visibility

the brand wants phased testing across environments

one touchpoint solves awareness while another solves conversion/trial

Good Hybrid Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid campaigns just to sound strategic. Recommend them only when they improve commercial fit materially.

12. Suppression Rules

The system should suppress or demote services when:

audience fit is weak

the environment can damage brand perception

permissions or access make the path unrealistic for the timeline

the budget makes the recommendation commercially misleading

the service solves a secondary objective but not the primary one

the recommendation depends on assumptions not yet acceptable for proposal stage

13. Ranking Matrix by Objective Pattern

13.1 Trial at Scale

13.2 Premium Targeted Trial

13.3 Education + Trial

13.4 Sell-Out Support

13.5 Awareness / Launch Buzz

14. Recommended Engine Logic Flow

When generating recommendations, the engine should apply this sequence:

classify industry

classify probable objective

classify target audience

classify environment sensitivity

classify trust sensitivity

classify scale-first vs precision-first need

retrieve ranked service candidates for that industry

rerank candidates based on objective and audience

suppress services failing misfit rules

promote pilot-first or hybrid path if conditions are met

generate primary, secondary, and optional expansion recommendation

15. Suggested Recommendation Output JSON

```
{
"industry": "Beauty / Skincare",
"objective": "Product Trial",
"target_audience": "Women Professionals",
"primary_recommendation": {
"service": "IT Park Sampling",
"rank_tier": "Tier 1",
"reason": "Strong fit for premium working-professional audience precision."
},
"secondary_recommendation": {
"service": "Mall Sampling / Mall Activation",
"rank_tier": "Tier 1",
"reason": "Useful if premium public visibility is also a major objective."
},
"optional_expansion": {
"service": "Hybrid Campaign Solution",
"reason": "Relevant if the brand wants phase-wise workplace plus public trial coverage."
},
"suppressed_options": [
{
"service": "LED Van / Mobile Outreach",
```

"reason": "Weak fit as a primary trial path for this audience and objective."

}

]

}

16. Validation Checklist

17. Publication Readiness Checklist — Pending Actions

Before this matrix goes live, AIM should complete the following:

founder review of all primary ranking assumptions

sales-head validation using 15–20 real past leads

ops validation where service feasibility can materially rerank choices

connect each ranked service to actual service-record logic IDs

test tie-breaker behavior across ambiguous multi-service leads

define admin-editable ranking override rules where necessary

18. Recommended Immediate Next Artifact

After this cross-industry recommendation matrix, the strongest next artifact is:

Industry-to-Service Decision Tree + Scenario Test Library

Reason:

the matrix defines the rules

the next step is to test those rules on real lead scenarios

this will help AIM catch wrong defaults before the engine goes live

AIM Beauty / Skincare — Industry Playbook

1. Document Purpose

This document contains the standalone Industry Playbook for Beauty / Skincare within the AIM Entity Brain knowledge-ingestion framework.

It is designed to help AIM capture how Beauty / Skincare brands think, buy, evaluate sampling/activation channels, and what commercial logic the Entity Brain should use when qualifying or recommending solutions.

This playbook should support:

discovery quality

service recommendation quality

pitch-angle selection

objection handling

scoring accuracy

case-study matching

founder-like commercial reasoning for beauty and skincare briefs

2. Industry Definition

Working Definition

Beauty / Skincare in the AIM context includes brands and product lines focused on:

facial skincare

body care

premium skincare

derma / active skincare

personal grooming products with skincare adjacency

cosmetic-skincare crossover products

self-care products where trial, routine fit, trust, and product education matter

Industry Characteristics

This category is usually:

highly target-group sensitive

perception-sensitive

environment-sensitive

trust-sensitive

trial-friendly when the right audience and context are chosen

often premium or semi-premium in positioning

Important Commercial Truth

For Beauty / Skincare, where the trial happens matters almost as much as how the trial happens.

The wrong environment can reduce brand fit even if the execution is operationally correct.

3. What the Entity Brain Must Know

The Entity Brain should understand the following about Beauty / Skincare briefs:

premium perception matters

environment quality affects response quality

target-group precision is usually more important than raw distribution scale

guided education can matter more than simple handout for some products

female-focused or premium-working-professional segments are often key

product trial can be powerful, but only when the setting aligns with product identity and target audience

brands may care about feedback, repeat usage intent, and trial quality more than just quantity

some subcategories need sensitivity around claims, skin type relevance, and demonstration tone

4. Buyer and Stakeholder Logic

Common Buyer Personas

Brand Manager

Marketing Manager

Category Manager

Founder / Co-Founder (especially D2C)

CMO / Marketing Head

Trade Marketing Manager

Growth / Performance-marketing influenced brand teams in D2C setups

Stakeholder Concerns

Beauty / Skincare decision-makers often care about:

relevance of target audience

premium fit of touchpoint

product education quality

perception risk

brand-image consistency

measurable post-trial signals

whether the activation feels “on-brand”

whether the environment attracts the right women / professionals / shoppers

Typical Internal Decision Dynamics

brand team may want premium fit and perception

trade team may want conversion or store movement

founder may want efficient pilot validation before scale

performance/growth stakeholders may ask about attribution or measurable response

5. Typical Business Objectives

Strongest Objectives in This Industry

product trial

premium target-group introduction

launch awareness

category education

guided trial for unfamiliar formulation/product

feedback capture after first use

targeted sampling to women professionals / premium shoppers / high-affinity segments

Secondary Objectives

lead capture for remarketing

QR / coupon-linked follow-up

retail conversion support

premium brand visibility

Weak / Misaligned Objectives

broad mass distribution with no target-group logic

low-quality reach for premium skincare brief

ultra-transactional performance expectation from touchpoint with no measurement design

aggressive sell-out expectation from a brand-awareness-only activity

6. Target Audience Logic

For Beauty / Skincare, the Entity Brain should push for greater audience clarity than in many FMCG categories.

Key Audience Dimensions to Capture

women / men / unisex relevance

age band

life stage

premium vs mass orientation

working professionals vs homemakers vs students

skin concern or category relevance if applicable

urban premium vs broad-market audience

purchase behavior: exploratory, routine, premium, problem-solution driven

High-Value Audience Patterns

women professionals in urban offices

premium mall shoppers

premium apartment communities

skincare-aware D2C shopper segments

wellness-oriented premium consumers

pharmacy / modern trade beauty buyers where education matters

Lower-Quality Audience Situations

broad unfiltered general crowd for premium skincare launch

environments that do not support brand identity or product explanation

settings where the trial audience is unlikely to be the buyer

7. Service Fit Logic for Beauty / Skincare

Strongest Service Fits

IT Park Sampling

Best when:

target is women professionals or urban working consumers

brand positioning is premium or aspirational

weekday high-quality audience matters

guided product introduction can be done efficiently

Mall Sampling / Mall Activation

Best when:

premium public visibility matters

the product benefits from visible trial and brand presence

the category needs aspirational retail/public context

kiosk or guided setup improves the experience

In-Store / Retail Sampling

Best when:

product education at point of purchase matters

retail conversion support is important

the brand is present in relevant modern trade or beauty retail environments

shopper hesitation can be reduced by in-store demo or explanation

Kiosk-Based Brand Activation / Demo Booth

Best when:

category education matters

the brand wants visual presence plus guided experience

the product requires more explanation than a simple sample handout

RWA / Apartment Sampling

Best when:

the product is highly relevant to women / families in premium communities

the objective is household-level trust and targeted community introduction

community context is a better fit than public venue

Moderate Service Fits

gym / studio outreach for skincare-wellness crossover or premium self-care angle

hybrid campaigns combining IT park + mall or mall + retail for layered objective

Weak / Misfit Service Fits

low-context mass distribution for premium skincare

youth-heavy campus-first campaigns unless the product truly fits that audience and brand tone

visibility-only mobile outreach unless part of a broader launch layer

8. Premium-Fit vs Mass-Fit Logic

Beauty / Skincare often requires the brain to reason about quality of audience and environment, not just volume.

Premium-Fit Signals

premium or semi-premium price point

founder/brand team emphasizes brand perception

product has routine or care-value rather than impulse-only nature

explanation, guided trial, or aspirational association matters

target audience is urban professional or premium shopper segment

Mass-Fit Signals

accessible price point with broad consumer relevance

trial at scale matters more than premium setting

product is simple enough for broader distribution environments

awareness is more important than elevated perception

Rule

If the brand is premium or skincare-education-led, the system should usually prefer audience-quality-first recommendations over mass-volume-first recommendations.

9. Discovery Question Bank — Beauty / Skincare Specific

These questions should be layered on top of service-specific discovery.

10. Quote-Critical Inputs for Beauty / Skincare

Before giving strong commercial direction in this industry, the system should try to know:

product category / SKU type

premium vs mass orientation

target user segment

environment preference or sensitivity

objective (trial / launch / education / retail support)

city or cities

scale or sample volume

engagement depth needed

budget band or budget openness

Minimum for Strong Recommendation

target user clear

product positioning clear

objective clear

city clear

probable touchpoint fit clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

engagement depth roughly known

environment quality preference roughly known

11. Feasibility / Delivery Considerations

Beauty / Skincare campaigns can fail commercially even when they are operationally completed. The brain should therefore treat brand-fit feasibility as well as execution feasibility seriously.

Important Feasibility Considerations

promoter grooming and product understanding

product explanation requirements

trial format suitability in venue

hygiene / handling requirements where applicable

whether demo/application context is simple or sensitive

premium-environment expectations vs actual execution scope

reporting expectations after trial

Brand-Fit Risks

cheap-feeling execution for premium product

wrong audience environment for brand tone

promoter interaction quality too weak for category depth

trial happening in a context that reduces perceived trust or desirability

12. Typical Objections and Response Directions

Response Principles

speak the language of audience quality, not just activity quantity

protect brand-image fit in every recommendation

do not sell scale-first if the brand is asking for premium relevance

use pilot framing when the brand is uncertain about touchpoint performance

13. Scoring Cues — Beauty / Skincare

Positive Signals

clear target user segment

premium-fit or audience-fit environment matters to the brand

product benefits from trial or education

brand is open to pilot-first validation

objective and segment are well articulated

the recommended touchpoint matches both audience and brand tone

Negative Signals

brand is premium but asks for low-quality mass distribution environment

no clarity on user segment

category education need is high but engagement budget is absent

expectation of strong conversion with no measurement design

touchpoint choice conflicts with brand positioning

Strategic Signals

high-credibility brand or D2C growth brand

strong case-study value in beauty/skincare vertical

potential for repeat use across launches / SKUs / regions

14. Recommendation Logic

When the lead is Beauty / Skincare, the system should prioritize recommendations using this order:

target user fit

brand-image / environment fit

objective fit

trial depth or education need

budget and feasibility

Typical Recommendation Patterns

Pattern A: Premium women professionals

IT Park Sampling

premium mall activation

pilot-first recommendation

Pattern B: Premium shopper/public visibility

Mall Sampling / Kiosk Activation

guided trial / demo support

Pattern C: Retail conversion support

In-Store / Retail Sampling

demo-led or education-led promoter support

Pattern D: Premium family / residential relevance

selective premium apartment / community sampling

Recommendation Output Style

The system should say things like:

“Because this is a premium skincare product targeting women professionals, a high-quality audience environment is likely more valuable than broad distribution volume.”

“A pilot across IT parks or premium mall environments may help validate trial quality before scale.”

“If product education is important, a kiosk/demo-led setup may perform better than handout-only distribution.”

15. Risk Flags

The system should explicitly warn when:

premium brand fit is being diluted by the recommended environment

audience precision is weak

product education need is high but execution is too light

the brief mixes performance expectations with awareness-only design

environment quality and brand expectations are misaligned

promoter/training requirements are underestimated

16. Case Study Tagging Guidance

Beauty / Skincare case studies should be tagged by:

premium vs mass orientation

women professionals / shoppers / families / youth audience

city

touchpoint

execution depth (handout / guided trial / demo / kiosk)

objective (trial / education / launch / retail support)

reporting depth

brand-positioning tone

Priority Case Study Buckets Needed First

premium skincare IT park sampling

beauty mall activation / kiosk example

skincare in-store retail education example

premium community sampling example

launch-stage trial + feedback example

17. Suggested JSON Shape

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Beauty / Skincare playbook goes live, AIM should complete the following:

founder review and wording approval

sales-head review of discovery prompts and objection handling

mapping of at least 3–5 relevant beauty/skincare case studies

validation of premium-vs-mass recommendation logic against real proposal history

refinement of buyer-persona notes based on AIM's actual client mix

confirmation of service-ranking logic across IT parks, malls, retail, and premium communities

20. Recommended Immediate Next Playbook

After this Beauty / Skincare industry playbook, the next best playbook to fill is:

FMCG / Snacks / Beverages

Reason:

it is high-volume and commercially important for AIM

it contrasts sharply with Beauty / Skincare in scale logic and environment sensitivity

it will help the Entity Brain learn when to prioritize mass-trial logic versus premium-fit logic

AIM Industry-to-Service Decision Tree + Scenario Test Library

1. Document Purpose

This document converts AIM's cross-industry recommendation logic into:

practical decision trees

scenario-based recommendation tests

expected outputs for evaluation

failure patterns to watch before go-live

It is designed to help AIM validate whether the Entity Brain can make founder-like decisions under realistic lead conditions.

This document should be used by:

founders

sales head

product/admin

engineering

QA/evaluation team

2. Why This Document Matters

The ranking matrix tells the system what is generally stronger.

But in real life, leads are messy.

A good engine must handle:

incomplete information

competing objectives

mixed audiences

budget/timeline tension

touchpoint bias from clients

category sensitivity

So this document exists to answer:

When a real lead appears, what path should the system follow, and what output should it generate?

3. Decision Tree Design Principles

Start with the business job, not the touchpoint the client casually mentions.

Check audience fit before cost optimization.

For sensitive or premium categories, environment quality can outrank raw scale.

If feasibility is weak, recommendation strength must drop even when fit looks good.

If multiple services are viable, choose the one that best solves the primary objective.

Use pilot-first when ambiguity is commercially meaningful.

Suppress attractive but misleading options.

4. Master Decision Flow

The engine should evaluate in this order:

identify industry

identify primary objective

identify target audience

identify trust / environment sensitivity

identify scale-first vs precision-first need

identify purchase-context need vs awareness-only need

identify handling / compliance / execution complexity

identify budget and timeline realism

identify whether one service clearly dominates or hybrid is justified

generate primary, secondary, optional expansion, and suppressed options

5. Core Decision Trees

5.1 Decision Tree A — Product Sampling vs Activation vs Mobile Visibility

Step 1

If the client’s primary job is trial, go to Sampling path.

Step 2

If the client’s primary job is education + trial + visible interaction, go to Activation path.

Step 3

If the client’s primary job is awareness / launch buzz / route visibility, go to Mobile Visibility path.

Rule

Do not recommend LED Van / Mobile Outreach as the primary solution when the client actually needs product trial or guided education.

5.2 Decision Tree B — Choosing the Right Sampling Environment

If target audience = working professionals

Prefer:

IT Park Sampling

premium mall only if public visibility matters too

workplace + premium hybrid if justified

If target audience = households / parents / families

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

mall/family-footfall only when public visibility is also useful

If target audience = shoppers close to purchase

Prefer:

In-Store / Retail Sampling

retail + activation hybrid

mall only if purchase-context route is weak but trial still valuable

If target audience = students / youth

Prefer:

College / Campus Sampling

youth-heavy activation

mall only if public youth relevance is stronger than campus access

If target audience = fitness / performance users

Prefer:

Gym / Fitness Sampling

gym + workplace hybrid

premium public setup only if visibility matters too

5.3 Decision Tree C — Trust-Sensitive Category Rule

Applies to

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule Path

If category is trust-sensitive:

evaluate whether environment feels credible and relevant

demote touchpoints that are operationally possible but contextually weak

prefer guided interaction when education matters

prefer pilot-first if audience/context performance is uncertain

Example

If Baby Care brief asks for broad public mall handout at scale:

do not reject immediately

but demote mall as primary unless family-footfall relevance is very strong and tone can remain controlled

promote residential or family retail alternatives first

5.4 Decision Tree D — Scale-First vs Precision-First

If category is FMCG / Snacks / Beverages

Ask:

is usage relevance broad?

is trial scale important?

are handling requirements manageable?

If yes:

recommend scale-capable environments first

If category is Beauty / Skincare, Wellness, Baby Care, Menstrual Hygiene, Pet Care

Ask:

does audience quality matter more than quantity?

does trust or education matter?

can the environment affect perception?

If yes:

recommend precision / quality-first environments first

5.5 Decision Tree E — Retail Conversion Need

If primary objective includes any of the following:

sell-out support

shopper education near purchase

store movement

pharmacy / retail conversion

Then:

promote In-Store / Retail Sampling to primary or near-primary rank

use mall / public trial only as a support layer if helpful

use awareness-led formats only as secondary support

Rule

Do not let “visibility” overpower “purchase-context need” when the client’s stated goal is sell-out or conversion support.

5.6 Decision Tree F — Pilot-First Trigger

Recommend pilot-first when any of these are true:

category is premium or trust-sensitive

the client is testing a new touchpoint

the environment fit is plausible but unproven

the product has handling or training complexity

the client wants proof before scale

multiple services look viable but not conclusively so

Output Pattern

primary recommendation

clear “pilot-first” label

phase 2 expansion path if pilot succeeds

5.7 Decision Tree G — Hybrid Recommendation Trigger

Recommend hybrid only when:

the brief includes two distinct audience clusters

the brief needs both trial and visibility

a single touchpoint solves only part of the job

the brand wants phase-wise validation across environments

Good Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid by default when one service clearly solves the main objective well enough.

6. Scenario Test Library Structure

Each scenario includes:

lead brief

industry

objective

audience

known facts

unknowns

expected primary recommendation

expected secondary recommendation

expected suppression logic

whether pilot-first should trigger

why this case matters

7. Scenario Test Library

7.1 Scenario 1 — Premium Skincare Launch for Women Professionals

Lead Brief

A premium skincare brand wants to launch a serum in Bangalore and is targeting women professionals aged 24–35. They are considering sampling, want quality audience more than mass distribution, and have moderate budget.

Classified Inputs

Industry: Beauty / Skincare

Objective: Product Trial + Premium Introduction

Audience: Women Professionals

Geography: Bangalore

Budget: moderate

Timeline: within 30 days

Expected Output

Primary: IT Park Sampling

Secondary: Mall Sampling / Mall Activation

Optional Expansion: IT Park + premium mall hybrid

Suppress: LED Van as primary

Pilot-First: Yes

Why

Audience precision is stronger than public visibility as the primary job.

7.2 Scenario 2 — Snack Brand Wants High-Volume Trial in Bangalore

Lead Brief

A snack brand wants 25,000 sample trials in Bangalore over 2 weeks. They are open to colleges, IT parks, and malls. Product is simple to distribute and there are no heavy handling constraints.

Classified Inputs

Industry: FMCG / Snacks / Beverages

Objective: Mass Trial

Audience: broad youth + office-goers

Geography: Bangalore

Budget: reasonable

Handling: simple

Expected Output

Primary: Hybrid Campaign Solution

Secondary: IT Park Sampling or College Sampling depending city mix

Optional Expansion: Mall sampling for public visibility layer

Suppress: premium-only narrow channels as sole recommendation

Pilot-First: No, unless budget/timeline uncertainty exists

Why

This is a scale-first, usage-friendly product with multiple viable high-volume environments.

7.3 Scenario 3 — Protein Beverage for Fitness Audience

Lead Brief

A wellness brand wants to push a protein hydration drink among active gym-goers in Bangalore and Hyderabad. The team wants the right users, not random scale.

Classified Inputs

Industry: Wellness / Nutrition

Objective: Trial + Affinity Audience Introduction

Audience: Fitness Users

Geography: Bangalore, Hyderabad

Priority: affinity-first

Expected Output

Primary: Gym / Fitness Sampling

Secondary: IT Park Sampling if office-going wellness crossover exists

Optional Expansion: gym + workplace hybrid

Suppress: random mall/public trial as primary

Pilot-First: Yes

Why

Credibility of context matters. Fitness relevance outranks generic high-footfall reach.

7.4 Scenario 4 — Baby Care Product for Young Parents

Lead Brief

A premium baby-care brand wants to introduce a new lotion to parents of infants and toddlers in Bangalore. They care about trust and relevance more than mass reach.

Classified Inputs

Industry: Baby Care

Objective: Trust-Building Trial

Audience: Parents of infants and toddlers

Geography: Bangalore

Priority: trust-first

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling

Optional Expansion: premium communities + retail hybrid

Suppress: college, gym, LED van as primary

Pilot-First: Yes

Why

Trust-relevant family environment should dominate the recommendation.

7.5 Scenario 5 — Menstrual Hygiene Campaign for College Students

Lead Brief

A menstrual hygiene brand wants to build awareness and trial among college-age women in Chennai and Bangalore. Education is as important as product introduction.

Classified Inputs

Industry: Menstrual Hygiene

Objective: Education + Trial

Audience: College students

Geography: Chennai, Bangalore

Tone sensitivity: high

Expected Output

Primary: College / Campus Sampling

Secondary: Kiosk-Based Education / Activation Booth

Optional Expansion: college + workplace phase 2 if brand expands audience

Suppress: LED Van as primary, generic mass public handout

Pilot-First: Yes

Why

Education and comfort fit matter more than raw broad reach.

7.6 Scenario 6 — Pet Food Trial for Premium Pet Parents

Lead Brief

A pet-food brand wants to reach dog owners in premium apartment communities in Bangalore. They do not want broad household waste.

Classified Inputs

Industry: Pet Care

Objective: Targeted Trial

Audience: Dog owners in premium communities

Geography: Bangalore

Priority: owner relevance

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling in pet retail environments

Optional Expansion: premium community + pet retail hybrid

Suppress: mall/public mass distribution as primary

Pilot-First: Yes

Why

Pet-owner density and audience precision are critical.

7.7 Scenario 7 — Beverage Launch Wants Buzz, Not Sampling

Lead Brief

A beverage brand wants city-wide launch buzz for 5 days in Bangalore and Hyderabad. They want strong visibility fast and are not focused on trial in phase 1.

Classified Inputs

Industry: FMCG / Beverages

Objective: Awareness / Launch Buzz

Audience: broad public

Geography: Bangalore, Hyderabad

Speed: high

Expected Output

Primary: LED Van / Mobile Outreach

Secondary: Mall Activation if public visibility and physical brand presence are also needed

Optional Expansion: mobile outreach + selective sampling in phase 2

Suppress: product sampling as sole phase-1 recommendation if trial is not the current job

Pilot-First: Not necessary unless city/route ambiguity is high

Why

The core job is visibility, not trial.

7.8 Scenario 8 — Skincare Brand Wants Retail Sell-Out Support

Lead Brief

A skincare brand is already in a retail chain and wants stronger trial and shopper education to improve sell-out in 20 stores.

Classified Inputs

Industry: Beauty / Skincare

Objective: Sell-Out Support

Audience: Retail shoppers near purchase

Geography: Bangalore

Retail context: strong

Expected Output

Primary: In-Store / Retail Sampling

Secondary: Kiosk-Based Demo support where useful

Optional Expansion: retail + selective mall awareness if needed later

Suppress: IT Park as primary unless secondary objective emerges

Pilot-First: Yes if store behavior is untested

Why

Purchase-context need outranks premium audience experimentation.

7.9 Scenario 9 — Ambiguous Marquee FMCG Brief

Lead Brief

A well-known FMCG brand says, “We want something impactful pan-India,” but shares no real audience, no budget, and no clear objective.

Classified Inputs

Industry: FMCG

Objective: unclear

Audience: unclear

Budget: unknown

Strategic value: high

Expected Output

Primary: No strong service recommendation yet

Secondary: none until discovery improves

Optional Expansion: not applicable yet

Suppress: premature multi-touchpoint grand solution

Pilot-First: not yet; first recommend structured discovery

Escalation: Yes, high-value but low-confidence

Why

The system must resist looking smart by inventing a solution too early.

7.10 Scenario 10 — Budget-Misaligned Premium Mall Request

Lead Brief

A new brand asks for a premium multi-city mall activation but indicates a very low budget and wants immediate execution.

Classified Inputs

Industry: unknown consumer brand

Objective: visibility + trial perhaps

Budget: weak

Timeline: aggressive

Requested touchpoint: premium mall

Expected Output

Primary: Re-scope / clarify, not direct mall confirmation

Secondary: lighter public trial or pilot recommendation if relevant

Suppress: premium mall rollout as-is

Pilot-First: Yes if the client shows flexibility

Escalation: only if strategic value is high

Why

The system must protect against unrealistic client-led touchpoint bias.

8. Negative Test Cases

These are scenarios where the system should fail safely rather than force a recommendation.

8.1 Negative Case — Too Little Information

Expected behavior:

ask next-best question

do not recommend a service confidently

do not mark proposal-ready

8.2 Negative Case — High Budget but Wrong Audience Context

Expected behavior:

demote attractive but brand-weak environments

explain why a more relevant environment is stronger

8.3 Negative Case — Client Insists on Misfit Touchpoint

Expected behavior:

acknowledge the requested touchpoint

explain limitations

suggest better alternative

do not blindly confirm requested service as primary

8.4 Negative Case — High Strategic Brand, Low Confidence

Expected behavior:

escalate

avoid overcommitting

produce structured missing-information summary

9. Scenario Evaluation Rubric

Use this rubric to judge whether the engine behaves correctly.

Suggested Pass Standard

A scenario should pass only if the system gets the primary path, suppression logic, and reasoning explanation broadly right.

10. Expected Failure Patterns to Watch

During testing, watch for these recurring failures:

recommending the client’s mentioned touchpoint too early

overvaluing scale in trust-sensitive categories

overvaluing premium environments for broad FMCG needs

recommending hybrid campaigns too often

recommending LED/mobile formats when the true job is trial or education

weak suppression of misfit services

false proposal-readiness despite major unknowns

11. Suggested Testing Cadence

Round 1: Founder Calibration

run 10 scenarios manually with founder review

compare system recommendation vs founder recommendation

Round 2: Sales Calibration

run 10–15 real historical leads

compare recommendation usefulness for sales users

Round 3: Ops Calibration

test feasibility-sensitive scenarios

check whether the system under-warns or over-warns

Round 4: Pilot Live Monitoring

log real-world scenarios where recommendation changed after human review

turn those into new test cases

12. Suggested Scenario JSON Format

```
{
"scenario_id": "SCN-001",
"industry": "Beauty / Skincare",
"objective": "Product Trial",
"target_audience": "Women Professionals",
"geography": ["Bangalore"],
"known_facts": [
"premium product",
"moderate budget",
"working women"
],
"expected_primary_recommendation": "IT Park Sampling",
"expected_secondary_recommendation": "Mall Sampling / Mall Activation",
"expected_suppressed_services": [
"LED Van / Mobile Outreach"
],
"pilot_first_expected": true
}
```

13. Validation Checklist

14. Publication Readiness Checklist — Pending Actions

Before this decision-tree and scenario library goes live, AIM should complete the following:

founder review of all major scenario expectations

sales-head review of recommendation usefulness across real examples

ops review for feasibility-sensitive cases

addition of 15–20 real AIM historical lead scenarios

mapping of each scenario to service-record and industry-playbook IDs

creation of pass/fail evaluation sheet for QA and pilot reviews

15. Recommended Immediate Next Artifact

After this decision-tree and scenario test library, the next strongest artifact is:

Founder Calibration Workbook + Historical Lead Test Set

Reason:

the rules are now defined

the next step is to validate them against AIM's actual founder judgment and past leads

this is the fastest way to catch wrong defaults before build hardening

AIM Product Sampling (Core) — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for Product Sampling (Core) from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas so that:

the main document remains lighter and safer to manage

the Product Sampling pack can be reviewed, validated, and iterated independently

AIM can use this as the working parent service record for ingestion

This is the parent service record for Product Sampling. Child services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

2. Service Record Header

3. Service Definition

Working Definition

Product Sampling is AIM's controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

4. Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following:

product trial

awareness through physical experience

new product launch support

target-group-specific introduction

category education

sell-out assistance in supported environments

feedback collection after trial

trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

5. Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

6. Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

7. Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

8. Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

9. Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known:

product category

target audience

geography

timeline band

sample volume or scale band

preferred touchpoint or touchpoint recommendation path

campaign model (pilot / rollout)

budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

10. Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following:

permission dependency by chosen touchpoint

product handling requirements

temperature / tasting / demo constraints if any

timeline realism

promoter/staffing need

branding/setup scope if applicable

city-level ops availability

reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

11. Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by:

touchpoint type

city and geography spread

sample volume

campaign duration

promoter/manpower need

setup / kiosk / branding requirement

permissions dependency

reporting complexity

handling complexity of sample product

campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

12. Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

13. Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

14. Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say:

“Product Sampling is a strong parent fit.”

then recommend child path(s) with reason

then show assumptions and missing inputs before final scoping

15. Risk Flags

The system should explicitly warn when:

product category and venue appear mismatched

target audience is too broad for current scope

timeline may not support permissions or setup

scale is too low for chosen touchpoint economics

attribution expectations exceed planned campaign design

sample handling requirements are still unclear

16. Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by:

industry

objective

touchpoint

geography

audience type

scale band

reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

17. Service Record JSON Shape (Suggested)

{

"service_name": "Product Sampling",

"service_code": "AIM-SVC-PS-001",

"service_type": "parent",

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of objections and discovery questions

ops validation of feasibility risks and handling constraints

case-study mapping for at least 3 strong parent references

confirmation of child-service inheritance model in knowledge schema

approval of parent scoring cues and escalation triggers

20. Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is:

IT Park Sampling

Reason:

it is one of AIM’s highest-value sampling variants

it frequently needs nuanced founder judgment

it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM's targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

19. Suggested JSON Shape

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Entity Brain — Product Requirements Document (PRD)

1. Document Summary

Product Name: AIM Entity Brain

Prepared For: AIM Leadership, Sales, Ops, Product, Engineering

Primary Goal: Convert founder-level commercial knowledge into a structured, scalable intelligence system that can qualify leads, guide discovery, recommend solutions, score opportunities, and sync clean intelligence into CRM.

2. Problem Statement

AIM’s best commercial judgment currently lives in the founders’ heads.

This creates recurring gaps: - Sales team depends too heavily on founders for requirement understanding and solution mapping. - Leads often come in with incomplete information, making proposal creation difficult or slow. - Discovery quality varies by salesperson. - Follow-up questions are sometimes repetitive, irrelevant, or not commercially useful. - CRM records are incomplete and inconsistent. - High-intent leads are not always identified early enough. - AI automation for chat or calling cannot work well without a strong company intelligence layer.

The business needs a system that can think more like a founder during lead intake and discovery.

3. Product Vision

AIM Entity Brain will be the company’s commercial reasoning layer.

It will: - understand services, sub-services, industries, deliverables, timelines, pricing logic, constraints, and case studies - ask the right next question based on context - avoid repetitive or low-value questioning - map lead requirements to solution pathways - score leads using AIM-specific commercial logic - assign the right salesperson or escalate for founder review - generate structured summaries and CRM-ready data - continuously improve from win/loss and human override feedback

This is not just a chatbot. It is a decision engine with memory, workflow, and learning.

4. Product Objectives

Primary Objectives

Improve discovery quality across all inbound leads.

Reduce founder dependency during lead qualification and solutioning.

Increase speed from inquiry to proposal readiness.

Improve CRM data quality and structured lead intelligence.

Create a reusable intelligence layer for sales copilot, chatbot, and AI telecalling.

Secondary Objectives

Improve lead routing and prioritization.

Reduce wasted effort on low-fit leads.

Standardize early-stage requirement gathering.

Improve consistency of proposal inputs.

Build long-term institutional memory.

5. Users

Primary Users

Sales Executives

Senior Sales Team

Sales Head

Founders

Business Development Team

Secondary Users

Operations team

Proposal team

CRM admins

Product and engineering team

External Users (Later Phase)

Website visitors

WhatsApp inquiry prospects

Outbound call recipients

6. User Problems to Solve

Sales Team Problems

“I do not know what to ask next.”

“I do not know if I have enough information to quote.”

“I do not know which service combination to pitch.”

“I need founder support for every nuanced inquiry.”

Founder Problems

“Sales keeps asking the same kind of questions.”

“Leads reach me with incomplete briefs.”

“Proposals are delayed because discovery was weak.”

“Commercial thinking is not standardized.”

Operations Problems

“Sales overpromises without checking feasibility.”

“Requirements are incomplete or vague during handoff.”

CRM Problems

“Lead records are incomplete.”

“Important commercial fields are unstructured.”

“Scoring and routing are inconsistent.”

7. Scope Definition

In Scope (Phase 1–3)

Service intelligence

Industry intelligence

Discovery question engine

Lead scoring engine

Solution recommendation engine

CRM field mapping

Internal sales copilot

External discovery chatbot

Case study retrieval

Proposal readiness assessment

Human override and feedback capture

Out of Scope (Initial Phase)

Fully autonomous proposal generation with final pricing approval

Fully autonomous discounting

End-to-end unattended telecalling at scale

Contract drafting automation

Final execution planning without human review

8. Core Product Principles

Ask only what changes the commercial decision.

Do not repeat what is already known.

Separate confirmed facts from inferred facts.

Do not promise beyond approved service logic.

When confidence is low, escalate to human review.

Every interaction should improve future intelligence.

9. Product Modules

9.1 Service Intelligence Engine

This module stores AIM’s service structure.

It should know: - service categories - sub-services - fit conditions - misfit conditions - ideal industries - ideal use cases - pricing bands - typical lead time - deliverables - exclusions - dependencies - risks - add-ons - reporting capabilities

Example Output

For a product sampling inquiry, the module should identify whether the use case is better suited for: - IT park sampling - mall activation - RWA sampling - in-store retail sampling - gym activation - quick commerce integration - multi-touchpoint pilot

9.2 Industry Intelligence Engine

This module stores how industries behave commercially.

It should know: - industry goals - buyer personas - decision cycles - budget behavior - common objections - relevant pitch angles - preferred channels/touchpoints - compliance or sensitivity issues - seasonality

Example

Skincare launches may require: - women-focused TG segmentation - premium environment fit - trial plus feedback mechanism - attribution discussion if D2C or marketplace-linked

9.3 Discovery Engine

This is the questioning brain.

It should: - identify critical missing information - select the next-best question - avoid duplicate questions - skip irrelevant questions - understand when enough information exists for the next stage - classify answers into structured CRM fields

Discovery Logic Rules

Each question should be tagged by: - service relevance - industry relevance - commercial purpose - mandatory for quote? - mandatory for feasibility? - mandatory for scoring? - ask-if conditions - skip-if conditions

Output Types

confirmed field update

inferred field update

missing information list

next-best question

9.4 Solution Mapper

This module translates discovery into recommended commercial solutions.

It should answer: - what service or sub-service fits best? - what touchpoint mix is appropriate? - should we propose pilot or full rollout? - what budget band is likely? - what timeline is realistic? - which case studies are relevant? - what risks should be flagged?

Example

If the lead is a beauty brand targeting working women in Bangalore with moderate budget and short timeline, the system may recommend: - IT parks + premium malls as primary mix - phase 1 pilot before scale - feedback capture + QR-based redemption - case studies from beauty/personal care category

9.5 FitScore Engine

This module calculates opportunity quality.

Score Components

Fit Score — 25

Authority Score — 15

Urgency Score — 15

Budget Score — 15

Completeness Score — 10

Strategic Value Score — 10

Feasibility Score — 10

Score Output Bands

80–100: High-priority qualified lead

60–79: Good lead, standard follow-up

40–59: Needs more information or nurture

Below 40: Low-fit or low-priority lead

Uses of Score

routing

SLA priority

founder escalation

proposal urgency

nurture vs immediate pursuit

9.6 Proposal Readiness Engine

This module checks whether enough information exists to move to proposal.

It should determine:

ready for capability deck only

ready for budgetary estimate

ready for scoped proposal

not ready; more discovery needed

It should also generate:

discovery summary

missing commercial inputs

suggested proposal modules

suggested case studies

suggested next action

9.7 CRM Intelligence Sync

This module converts conversation into structured CRM records.

It should update:

lead basic profile

service and sub-service

industry

objective

budget band

timeline

authority level

target audience

geography

completeness score

total lead score

recommended owner

recommended next step

missing information

It should also trigger:

task creation

SLA tagging

owner assignment

escalation to sales head/founder if required

9.8 Sales Copilot

This is the first interface to launch.

Primary Capabilities

show current lead understanding

show missing fields

suggest next questions during live call/chat

recommend service path

show lead score

show risks and assumptions

suggest case studies and pitch angle

indicate proposal readiness

Success Outcome

A salesperson should be able to handle a nuanced discovery conversation with much less founder intervention.

9.9 Discovery Chatbot

This is the second interface to launch.

Channels

website

WhatsApp

chat widget

Primary Capabilities

welcome and classify inquiry

ask context-aware questions

avoid repetitive questions

gather structured requirement data

create CRM lead

summarize requirements before handoff

hand over to human with clean context

Design Principle

The experience should feel like a smart pre-consultation, not a long lead form.

9.10 Voice Prospecting Engine (Later Phase)

This is the third interface to launch.

Uses

cold outreach

qualification calls

callback handling

early intent screening

It should use the same brain for:

pitch selection

objection handling

qualification logic

next-step routing

Strong Controls Needed

human escalation rules

no unsupported claims

no unapproved commercial commitments

call review and audit trail

10. Core Data Model

Key Objects

Service Master

Sub-Service Master

Industry Playbook

Discovery Question Bank

Solution Rules

Lead Profile

Lead Answers

Case Study Library

Objection Library

Proposal Modules

Feedback Events

Version Log

Field Status Types

Each commercially important field should have a status: - Confirmed - Inferred - Missing - Not Applicable

This is important so the system never confuses assumptions with actual customer-provided facts.

11. CRM Field Definitions

Lead Identity

company_name

contact_name

designation

phone

email

12. Key User Flows

12.1 Inbound Lead via Website / WhatsApp

User starts inquiry.

System classifies probable service and industry.

Relevant discovery logic loads.

Bot asks next-best question.

Structured fields are populated.

Lead score updates in real time.

Proposal readiness is evaluated.

CRM record is created/updated.

Salesperson is assigned.

Discovery summary is pushed to assigned owner.

12.2 Salesperson-Assisted Discovery

Salesperson opens lead.

Copilot shows known data and missing commercial fields.

Copilot suggests next-best questions.

Salesperson captures answers.

Engine updates score and recommendations.

Proposal readiness is checked.

Next action is recommended.

12.3 Founder Review Escalation

Lead has high strategic value or low confidence.

System flags for founder review.

Founder sees summarized context, missing information, and system recommendation.

Founder accepts, edits, or overrides.

Override is stored as learning input.

13. Screens / Interface Requirements

13.1 Lead Intelligence Dashboard

Must show: - lead overview - service classification - key requirement fields - score breakdown - confidence level - missing information - suggested next questions - recommended owner - proposal readiness

13.2 Discovery Panel

Must show: - live transcript or answer stream - questions already asked - fields already collected - next-best question suggestions - skipped questions and reason

13.3 Solution Recommendation Panel

Must show: - recommended service mix - why it is recommended - alternative options - likely budget band - timeline band - case studies - risks

13.4 Founder Review Panel

Must show: - summary - score - assumptions - missing information - escalation reason - approve / modify / override actions

13.5 Admin Knowledge Management Panel

Must allow: - add/edit services - add/edit question bank - update scoring logic - tag case studies - version control - activate/deactivate outdated logic

14. Functional Requirements

Must Have

structured service and industry knowledge storage

context-aware questioning

field-level state tracking

CRM field mapping

lead scoring

assignment logic

proposal readiness detection

human override capture

case study retrieval

audit logs

Should Have

objection handling suggestions

pitch-angle recommendation

email/WhatsApp summary generation

founder override analytics

win/loss learning dashboards

Later

AI voice calling

automated meeting scheduling

auto-generated tailored proposal drafts

predictive win probability

15. Non-Functional Requirements

fast enough for live salesperson use during calls

support multi-turn stateful conversations

secure access control by role

full auditability of question/answer flow

version control for service logic

scalable across multiple services and future brands

reliable CRM sync

fallback behavior if model confidence is low

16. Guardrails and Governance

Commercial Guardrails

no final price commitment without approved logic

no unsupported delivery promise

no unauthorized discounts

no invented case studies or results

Reasoning Guardrails

always distinguish confirmed vs inferred data

ask only relevant questions

never repeat confirmed questions

stop when enough information is available

escalate when confidence falls below threshold

Operational Guardrails

all high-value leads with low confidence require review

all overrides should be logged

all service definitions and question logic must be versioned

17. Analytics and Success Metrics

Sales Productivity Metrics

founder interruptions per lead

average discovery completeness score

average time to proposal readiness

average time from inquiry to first qualified summary

Lead Quality Metrics

qualified lead rate

high-score lead conversion rate

disqualification accuracy

proposal-to-win ratio

Bot Quality Metrics

duplicate question rate

irrelevant question rate

missing-field rate after discovery

confidence/escalation rate

structured field accuracy

Learning Metrics

number of founder overrides

override categories

recommendation accuracy over time

score accuracy vs actual sales outcomes

18. Phased Rollout Plan

Phase 1 — Knowledge and Logic Foundation

Deliverables

service taxonomy

sub-service taxonomy

industry playbooks

discovery question bank

lead scoring model

CRM field map

case study library tagging

founder override workflow

Goal

Create the structured commercial brain.

Phase 2 — Internal Sales Copilot

Deliverables

lead intelligence dashboard

live discovery assistant

CRM sync

score and routing engine

proposal readiness engine

Goal

Improve internal discovery and reduce founder dependence.

Phase 3 — External Discovery Bot

Deliverables

website/WhatsApp bot

stateful questioning

automatic lead structuring

human handoff summary

Goal

Qualify inbound leads consistently before sales handoff.

Phase 4 — Voice Prospecting Engine

Deliverables

AI outbound calling

transcript intelligence

callback routing

objection capture

review dashboard

Goal

Scale prospecting using the same entity brain.

19. Risks

Risk 1: Overloading with raw documents

Mitigation: normalize critical knowledge into structured entities.

Risk 2: Weak discovery logic

Mitigation: start with founder-reviewed question banks and override loops.

Risk 3: Overpromising by AI

Mitigation: strong commercial guardrails and required confidence thresholds.

Risk 4: Low user adoption by sales team

Mitigation: design for live call usability and measurable productivity benefits.

Risk 5: Incorrect scoring early on

Mitigation: tune scoring model with real lead outcomes and founder reviews.

20. MVP Definition

MVP Includes

core services and sub-services

top target industries

60–100 curated discovery questions

service recommendation logic

scoring engine

CRM writeback

internal sales copilot

founder review/override capture

MVP Excludes

public chatbot at launch

voice calling at launch

autonomous final pricing

autonomous proposal issuance

21. Launch Recommendation

Launch order should be: 1. Knowledge Core 2. Sales Copilot 3. CRM Intelligence Sync 4. External Discovery Bot 5. Voice Prospecting Engine

This sequence gives the fastest ROI and the safest learning loop.

22. Final Recommendation

AIM should build this first as an internal commercial intelligence and discovery copilot, not as a public chatbot.

Reason: - internal copilot creates immediate value - improves lead quality and CRM quality - generates training data - validates discovery logic safely - reduces founder dependency before customer-facing automation

Once internal discovery is strong, the same brain can power inbound chatbot and outbound AI calling with much higher accuracy and much lower risk.

23. Next Document to Create

After this PRD, the recommended next documents are: 1. Functional specification by module 2. CRM field mapping sheet 3. Knowledge model / ontology document 4. User stories and acceptance criteria 5. API and integration specification 6. Wireframes for dashboard and copilot screens 7. Rollout plan with owners and milestones

24. Module-wise Functional Specification

24.1 Module: Knowledge Core

Purpose

Store and manage AIM’s structured commercial intelligence.

Inputs

service definitions

sub-service definitions

industry playbooks

discovery questions

pricing bands

case studies

objections

proposal modules

execution constraints

version changes

Core Functions

create and maintain service records

create and maintain industry records

manage question bank with conditions

manage solution rules

manage case study tagging

manage version history

activate/deactivate outdated logic

Outputs

structured knowledge objects for orchestration engine

searchable case studies and commercial assets

version-controlled service logic

Business Rules

every active service must have at least one discovery path

every service must define mandatory inputs for quote and feasibility

every question must be mapped to a field or decision purpose

outdated logic must not be used in live workflows once deactivated

Dependencies

admin panel

database

retrieval store

access control

Admin Actions

add service

edit service

archive service

add industry playbook

edit questions

adjust scoring logic references

upload case study assets

24.2 Module: Discovery Engine

Purpose

Run context-aware questioning and field-state tracking.

Inputs

current lead state

known fields

missing fields

service context

industry context

prior questions asked

confidence signals

Core Functions

classify inquiry

identify critical unknowns

select next-best question

avoid duplicate questioning

mark fields as confirmed/inferred/missing/not applicable

determine if enough information exists to proceed

Outputs

next-best question

updated field state

missing information list

discovery summary

proposal readiness signal

Business Rules

do not ask a question if field is already confirmed unless clarification is required

ask only questions relevant to current service and stage

stop discovery when minimum information threshold is reached for next step

low-confidence inference must be marked as inferred, not confirmed

Dependencies

knowledge core

orchestration engine

CRM field map

conversation layer

24.3 Module: Solution Mapper

Purpose

Translate discovered requirements into commercially relevant solution paths.

Inputs

service classification

industry classification

discovered lead attributes

solution rules

case studies

pricing references

feasibility notes

Core Functions

recommend service and sub-service mix

recommend touchpoint mix

suggest pilot vs full rollout

estimate budget band

estimate timeline band

identify relevant case studies

highlight delivery risks and dependencies

Outputs

recommended solution path

alternative options

budget band suggestion

timeline guidance

case study shortlist

risk flags

Business Rules

no final pricing commitment without approved pricing logic

if feasibility is unclear, flag human review

solution recommendations must reference only active services

24.4 Module: FitScore Engine

Purpose

Score the lead according to AIM-specific commercial logic.

Inputs

authority data

fit data

budget data

urgency data

completeness state

feasibility state

strategic value indicators

Core Functions

calculate component scores

calculate total score

assign lead band

recommend SLA level

recommend escalation path

Outputs

score breakdown

total score

confidence score

routing recommendation

Business Rules

missing critical fields should reduce completeness and confidence

high strategic value can increase priority but should not hide feasibility issues

leads above configured threshold should trigger faster assignment

24.5 Module: CRM Intelligence Sync

Purpose

Map structured lead intelligence into CRM and trigger workflow.

Inputs

lead identity data

discovered commercial fields

scores

recommendations

ownership logic

Core Functions

create new lead

update existing lead

write structured fields

create tasks

assign owner

tag SLA priority

attach discovery summary

log recommendations and missing data

Outputs

CRM record

owner assignment

task queue entries

activity log

Business Rules

required lead fields must be validated before CRM sync

existing leads should be updated, not duplicated, where match confidence is sufficient

every CRM write must be auditable

24.6 Module: Sales Copilot

Purpose

Support salespeople in live discovery, qualification, and next-step planning.

Inputs

CRM lead state

discovery engine output

score output

solution recommendations

Core Functions

display lead understanding

display missing fields

suggest next questions live

show recommended pitch angle

show case studies and risks

show proposal readiness

Outputs

salesperson guidance

improved discovery quality

faster handoff to proposal stage

Business Rules

salesperson must be able to override system suggestions

overrides must be logged with reason if they change major fields or recommendations

24.7 Module: Discovery Chatbot

Purpose

Run external prospect qualification in a structured but conversational way.

Inputs

prospect messages

channel context

discovery logic

known company/contact data

Core Functions

greet and classify inquiry

ask next-best question

maintain state across turns

summarize requirement

sync to CRM

hand off to human when appropriate

Outputs

structured lead brief

handoff summary

live lead score

Business Rules

no repetitive questions

do not request unnecessary information

escalate when prospect asks for commitments outside approved scope

preserve context across channel turns where technically possible

24.8 Module: Founder Review & Override

Purpose

Allow high-value or low-confidence leads to be reviewed and corrected by founder/sales head.

Inputs

lead summary

score

confidence status

escalation reason

system recommendation

Core Functions

show escalation context

allow approval/edit/override

log override reason

write override back into system

feed override into learning loop

Outputs

final approved direction

learning signal

updated CRM and recommendation state

Business Rules

all overrides must be logged

override should distinguish between pricing correction, service correction, discovery correction, or routing correction

24.9 Module: Learning & Evaluation Layer

Purpose

Improve the brain over time through outcomes and review.

Inputs

lead outcomes

win/loss reasons

override logs

question quality ratings

recommendation accuracy reviews

Core Functions

track performance by module

identify failure patterns

identify weak questions

identify weak scoring rules

support review cycles

suggest updates to knowledge logic

Outputs

evaluation dashboards

quality reports

update recommendations

Business Rules

only approved logic updates should affect production behavior

historical outcomes should remain linked to the version used at the time

25. User Stories

25.1 Sales Executive

As a sales executive, I want to see the missing information for a lead so that I know what to ask next.

As a sales executive, I want the system to suggest relevant questions during a call so that I can conduct better discovery.

As a sales executive, I want to know whether the lead is ready for proposal so that I do not waste time preparing incomplete quotes.

As a sales executive, I want the system to suggest the right service mix so that I can pitch confidently.

As a sales executive, I want case study recommendations relevant to the lead so that I can strengthen my conversation.

25.2 Sales Head

As a sales head, I want high-intent leads to be prioritized automatically so that the team focuses on the right opportunities.

As a sales head, I want low-confidence but high-value leads to be escalated so that important opportunities are not mishandled.

As a sales head, I want to review scoring logic and override patterns so that I can improve sales quality.

25.3 Founder

As a founder, I want the system to capture my commercial reasoning in structured form so that the company can scale beyond founder dependency.

As a founder, I want to review escalated leads with complete context so that I can intervene quickly and effectively.

As a founder, I want overrides to improve the system so that repeated corrections reduce over time.

25.4 Operations Manager

As an operations manager, I want the sales handoff to include clear deliverables, assumptions, and risks so that execution planning is accurate.

As an operations manager, I want feasibility-sensitive leads to be flagged early so that sales does not overpromise.

25.5 CRM Admin

As a CRM admin, I want structured field mapping from conversations so that lead records remain clean and useful.

As a CRM admin, I want duplicate lead checks before sync so that the CRM stays reliable.

25.6 External Prospect

As a prospect, I want the chatbot to ask relevant questions without repetition so that the experience feels intelligent and professional.

As a prospect, I want the system to understand my requirement before transferring me to a salesperson so that I do not have to repeat myself.

26. Acceptance Criteria

26.1 Knowledge Core

Admin can create, edit, archive, and version services.

Admin can attach mandatory discovery fields to each active service.

Admin can map each question to a field or decision purpose.

Archived service logic is not used in new live recommendations.

26.2 Discovery Engine

System does not ask a field-confirming question again unless clarification is needed.

System selects questions based on service, industry, stage, and missing critical fields.

System marks each important field as confirmed, inferred, missing, or not applicable.

System can indicate when sufficient information exists for the next stage.

26.3 Solution Mapper

System provides at least one recommended solution path when minimum discovery threshold is met.

System includes risk flags when feasibility-related data is weak or missing.

System does not generate solution recommendations using inactive services.

26.4 FitScore Engine

System calculates and stores component-wise score breakdown.

System assigns lead band based on configured thresholds.

System recalculates score when critical new answers are added.

26.5 CRM Intelligence Sync

System can create a new lead with required structured fields.

System can update an existing lead without creating duplicates where match logic is satisfied.

Every CRM write action is logged with timestamp and source.

26.6 Sales Copilot

Sales user can see known fields, missing fields, score, and next-best questions in one view.

Sales user can submit an override to system suggestions.

Override reason is stored for review when major changes are made.

26.7 Discovery Chatbot

Bot can maintain context across at least one multi-turn discovery flow.

Bot avoids duplicate questions within the same conversation.

Bot can produce a structured lead summary before human handoff.

Bot can hand off to human when low confidence or out-of-scope request is detected.

26.8 Founder Review

Escalated lead shows score, confidence, summary, risks, and recommendation in one place.

Founder can approve, edit, or override system recommendation.

Override is recorded and sent to learning layer.

26.9 Learning Layer

System stores lead outcome and override events.

System can report question quality and recommendation accuracy trends.

Logic updates require approval before being activated in production.

27. Screen-wise Requirements

27.1 Screen: Lead Intelligence Dashboard

Must Display

lead profile header

company/contact details

source channel

service classification

score breakdown

confidence indicator

proposal readiness status

missing information list

recommended next action

Actions

open discovery panel

assign owner

escalate for review

sync/update CRM

open related case studies

27.2 Screen: Live Discovery Assistant

Must Display

current conversation transcript or notes

questions already asked

next-best question suggestions

field status tracker

answer capture inputs

Actions

mark answer as confirmed

edit inferred values

skip question with reason

request founder review

27.3 Screen: Solution Recommendation Panel

Must Display

recommended service mix

recommended touchpoints

estimated budget band

estimated timeline band

case study suggestions

assumptions

risks and exclusions

Actions

accept recommendation

choose alternative recommendation

send to proposal stage

escalate

27.4 Screen: Founder Review Panel

Must Display

escalation reason

system summary

system score

confidence status

recommendation

override history if any

Actions

approve

edit fields

override recommendation

change owner

send feedback to system

27.5 Screen: Knowledge Admin Panel

Must Display

list of services

list of industries

list of question banks

version history

active/inactive status

Actions

add/edit/archive entries

change question conditions

upload case studies

publish new version

28. Workflow State Definitions

29. Integration Specification Summary

CRM Integration

create/update lead

field sync

owner sync

task creation

status updates

activity logging

Communication Integration

website chat

WhatsApp

email ingestion

voice/call transcripts in later phase

Retrieval Inputs

case studies

service documents

pitch decks

proposal archives

transcripts

SOPs

30. Release Plan by Sprint Theme

Sprint Theme 1

finalize data model

finalize service taxonomy

finalize question bank framework

Sprint Theme 2

build knowledge admin layer

build service and industry records

build field-state model

Sprint Theme 3

build discovery engine logic

build next-best question selector

build scoring engine

Sprint Theme 4

build lead intelligence dashboard

build sales copilot interface

build CRM sync

Sprint Theme 5

founder review workflow

override logging

evaluation dashboard basics

Sprint Theme 6

external discovery bot beta

handoff summary generation

pilot testing with selected inbound channels

31. Recommended Next Deliverables

The next documents to create after this functional specification are: 1. Detailed CRM field mapping sheet 2. Service taxonomy sheet 3. Discovery question matrix by service and industry 4. Scoring model configuration sheet 5. Wireframes for dashboard, copilot, and founder review screens 6. API contract and event schema 7. Pilot rollout plan with ownership and milestones

32. Detailed CRM Field Mapping Sheet

This section defines the recommended CRM field structure for AIM Entity Brain.

The objective is to ensure that every discovery conversation produces: - clean structured CRM data - commercially useful lead records - reliable routing and prioritization - proposal-readiness visibility - auditability of inferred vs confirmed information

Field Design Principles

Every critical commercial field must have a clear source.

Important fields should distinguish between confirmed and inferred values.

Fields should support both human entry and AI-generated updates.

CRM fields must support downstream actions such as assignment, SLA, proposal preparation, and escalation.

Free-text notes should not replace structured fields for core qualification data.

32.1 Lead Identity Fields

32.2 Company Intelligence Fields

32.3 Contact Authority Fields

Recommended Decision Maker Status Values

Final Decision Maker

Strong Influencer

Evaluator / Researcher

Procurement Only

Agency Intermediary

Unknown

32.4 Requirement Classification Fields

Recommended Inquiry Type Values

New Requirement

Repeat Requirement

Capability Check

Budgetary Exploration

Proposal Follow-up

Partnership Inquiry

Vendor Registration

32.5 Timeline and Volume Fields

Recommended Timeline Urgency Values

Immediate (0–7 days)

Within 30 Days

Within Quarter

Exploratory / No Fixed Timeline

32.6 Budget and Commercial Fields

Recommended Budget Band Values

Below 1L

1L–3L

3L–10L

10L–25L

25L+

Unknown

32.7 Qualification and Discovery Fields

Recommended Proposal Readiness Values

Not Ready

Ready for Capability Deck

Ready for Budgetary Estimate

Ready for Scoped Proposal

Needs Human Review

32.8 Scoring Fields

Recommended Lead Priority Bands

High Intent Priority

Qualified Priority

Nurture / Clarify

Low Priority

Disqualify

32.9 Routing and Ownership Fields

Recommended Next Action Values

Schedule Discovery Call

Send Capability Deck

Send Budgetary Estimate

Prepare Proposal

Founder Review

Nurture

Disqualify

32.10 Solution Recommendation Fields

32.11 Channel Conversation Fields

32.12 Audit and Learning Fields

32.13 Required Minimum Field Set by Stage

Stage: New Lead

Required minimum: - lead_id - company_name or phone/email - source_channel - lead_origin_type - first_contact_timestamp

Stage: Discovery In Progress

Required minimum: - service_category - industry_primary - requirement_summary - discovery_stage - requirement_completeness_score - next_best_question

Stage: Qualified / Assigned

Required minimum: - total_lead_score - lead_priority_band - recommended_owner_team - SLA_priority - proposal_readiness_status - missing_information_summary

Stage: Proposal Ready

Required minimum: - service_category - sub_service_category (if known) - campaign_objective_primary - target_geography - timeline_urgency_band - budget_band - proposal_readiness_status - assumptions - risk_flags

32.14 Field Source Hierarchy

When multiple sources provide values, use this order unless manually overridden: 1. Human-confirmed user input 2. Founder / sales head override 3. Salesperson confirmed entry 4. Reliable system enrichment 5. AI inference

Rule

If AI inference conflicts with human-confirmed data, human-confirmed data wins.

32.15 Recommended CRM Object Structure

Lead Object

Stores primary lead identity and qualification state.

Account Object

Stores company-level long-term information.

Contact Object

Stores contact-level person details.

Opportunity Object

Created when lead reaches commercial seriousness threshold.

Activity Object

Stores calls, chats, emails, tasks, and follow-up actions.

Intelligence Snapshot Object

Stores AI-generated summary, scores, recommendation, assumptions, and confidence state for each major interaction cycle.

32.16 Recommended System Events

lead.created

lead.updated

discovery.started

discovery.answer.captured

discovery.completed

score.updated

owner.assigned

escalation.triggered

proposal.readiness.changed

founder.override.created

outcome.recorded

These events will help product and engineering maintain auditability and workflow automation.

32.17 Implementation Notes

Use structured enums wherever possible for routing-critical fields.

Keep requirement_summary, missing_information_summary, assumptions, and risk_flags as generated long-text fields, but do not depend only on them.

Preserve all major AI writes with timestamps and version metadata.

Keep score components stored separately, not just the total score.

Ensure duplicate detection uses phone, email, company, and source-side identifiers where available.

Make proposal_readiness_status and quote_readiness_status separate fields.

Every field updated by AI should carry a traceable source or origin in the data_origin_map.

32.18 Recommended Next Document

After this CRM mapping sheet, the next most important document is: Service Taxonomy + Discovery Question Matrix by Service and Industry

That will define exactly what AIM sells, where it fits, and what the system must ask before recommending or quoting.

33. Service Taxonomy Sheet

This section defines the recommended AIM service taxonomy for the first production version of the Entity Brain.

The purpose of this taxonomy is to ensure that the system can: - classify inquiries correctly - understand service fit and misfit - know what information is required before quoting - know what information is required before feasibility confirmation - map requirements into the correct commercial path

Taxonomy Design Principles

Start with a limited number of commercially meaningful service categories.

Separate service categories from touchpoints.

Distinguish quote inputs from feasibility inputs.

Define misfit cases clearly so the system knows when not to push a service.

Ensure each active service has at least one discovery path and one proposal path.

33.1 AIM Core Service Categories

Level 1 Categories

Product Sampling

On-Ground Brand Activation

Retail / In-Store Branding

Transit / Mobile Outreach

Residential Community Outreach

Corporate / Workplace Outreach

College / Youth Outreach

Fitness / Lifestyle Outreach

Mall / Public Venue Activation

Hybrid Campaign Solutions

Notes

Some categories are solution categories.

Some are execution environment categories.

For the Entity Brain, this is acceptable as long as the system clearly maps service logic and touchpoint logic separately.

33.2 Service Taxonomy Table

33.3 Detailed Service Definitions

33.3.1 Product Sampling

Description

AIM executes controlled product trial campaigns across selected touchpoints to drive awareness, trial, and in some cases conversion or attribution.

Primary Use Cases

product launches

new market entry

consumer trial

sell-out support

brand awareness with sampling

trial-to-conversion campaigns

Typical Industries

FMCG

beauty and skincare

personal care

wellness and nutrition

beverages and food

baby care

pet care

menstrual hygiene

Core Deliverables

touchpoint planning

promoter deployment

sample distribution

interaction or engagement execution

reporting and proof of execution

optional feedback capture

optional redemption or conversion-linked mechanism

Mandatory Quote Inputs

product category

city/cities

target audience

planned scale or sample volume

desired timeline

preferred touchpoints

Mandatory Feasibility Inputs

permission dependency

sample handling/storage constraints

staff requirement

venue access model

activation hours or timing restrictions

Common Risks

unclear target audience

unrealistic timeline

mismatch between brand and touchpoint

insufficient permissions lead time

no clarity on sample volume

33.3.2 On-Ground Brand Activation

Description

AIM creates interactive brand experiences to drive engagement, education, recall, and trial.

Primary Use Cases

new launches

experiential engagement

product demonstration

lead generation in physical environments

recall campaigns

Typical Industries

consumer brands

personal care

wellness

FMCG

electronics and appliance retail tie-ins

Mandatory Quote Inputs

venue type

activation objective

duration

branding scope

promoter/staffing expectation

Mandatory Feasibility Inputs

space availability

fabrication requirements

venue permissions

power or display requirements

safety or compliance restrictions

33.3.3 Retail / In-Store Branding

Description

AIM executes store-level visual branding and shopper visibility solutions.

Primary Use Cases

retail launch visibility

store branding rollout

shelf impact improvement

shopper conversion support

Mandatory Quote Inputs

store count

city/cities

element types required

quantity per store

execution timeline

Mandatory Feasibility Inputs

store measurement availability

retailer approvals

material specifications

installation windows

access conditions

33.3.4 Transit / Mobile Outreach

Description

AIM executes route-based, vehicle-based, or transit-facing brand visibility campaigns.

Primary Use Cases

awareness campaigns

launch buzz

route-based reach

hyperlocal visibility

Mandatory Quote Inputs

city

vehicle type

duration

quantity

date range

Mandatory Feasibility Inputs

inventory availability

local permissions

route constraints

branding production lead time

33.3.5 Hybrid Campaign Solutions

Description

AIM combines multiple touchpoints under one campaign objective for broader relevance and reach.

Primary Use Cases

multi-audience launch

pilot + scale rollout

integrated visibility + trial campaign

category education across multiple environments

Mandatory Quote Inputs

campaign objective

target segments

geography

budget band

timeline

Mandatory Feasibility Inputs

cross-touchpoint ops readiness

permissions dependency map

staffing availability

reporting framework needs

33.4 Industry Fit Notes

33.5 Service Misfit Logic

The Entity Brain should explicitly disqualify or deprioritize opportunities when any of the below are true: - the requested touchpoint does not match the target audience - the lead wants a firm quote without minimum commercial information - timeline is too short relative to permission and ops dependencies - product category is incompatible with venue or audience - stated budget is far below realistic threshold and client shows no flexibility - client expectation depends on outcomes not reasonably controllable by the service - there is no viable permission or access route

34. Discovery Question Matrix by Service and Industry

This matrix defines what the Entity Brain should ask before recommending, scoring, routing, or quoting.

Matrix Design Principles

Questions must have a purpose.

Questions must map to a field or decision.

The system should distinguish must-ask from nice-to-have.

The system should know which question affects quote, feasibility, score, or case-study selection.

The system should not ask the same question in multiple ways unless clarification is needed.

Question Type Tags

Must Ask = essential for qualification or solutioning

Quote Critical = required before meaningful budgetary estimate or proposal

Feasibility Critical = required before delivery confidence

Scoring Critical = affects lead quality or routing

Optional Depth = helpful, not mandatory in first pass

34.1 Universal Discovery Core Questions

These questions apply to almost all services.

34.2 Product Sampling — Core Discovery Matrix

34.3 IT Park Sampling — Service-Specific Questions

34.4 RWA / Apartment Sampling — Service-Specific Questions

34.5 Mall Sampling / Mall Activation — Service-Specific Questions

34.6 In-Store / Retail Sampling — Service-Specific Questions

34.7 College / Youth Sampling — Service-Specific Questions

34.8 Gym / Fitness Sampling — Service-Specific Questions

34.9 Brand Activation / Kiosk — Service-Specific Questions

34.10 Retail / In-Store Branding — Service-Specific Questions

34.11 LED Van / Mobile Outreach — Service-Specific Questions

34.12 Hybrid / Multi-Touchpoint Campaign — Service-Specific Questions

34.13 Industry-Specific Question Add-Ons

FMCG / Foods / Snacks

Beauty / Skincare / Personal Care

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

34.14 Question Priority Rules

The Entity Brain should use the following order when choosing the next question: 1. Questions required to understand objective and audience 2. Questions required to identify service fit 3. Questions required to assess timeline and feasibility 4. Questions required to understand scale and budget 5. Questions required to refine proposal quality 6. Optional depth questions only after the above are sufficiently answered

34.15 Stop Rules for Discovery

Discovery should pause and route to the next stage when: - objective is known - target audience is known - geography is known - probable service fit is known - timeline is known at least in band form - budget is known or reasonably inferred for next step - critical feasibility blockers are either known or flagged

If these are not available, the system should not mark the lead as proposal-ready.

34.16 Escalation Rules During Discovery

Escalate to founder or sales head when: - high-value brand but very low confidence - requirement spans multiple service categories with unclear commercial priority - prospect requests final pricing too early without critical data - service fit is ambiguous or appears weak - feasibility risk is high due to timeline, permissions, or category sensitivity - the prospect is a strategic account or marquee brand

34.17 Recommended Next Document

After this Service Taxonomy and Discovery Matrix, the next strongest document is: Scoring Configuration Sheet + Wireframes for Lead Intelligence Dashboard and Live Discovery Assistant

That will convert the logic into usable system behavior and UI structure.

35. Scoring Configuration Sheet

This section defines the detailed scoring logic for AIM Entity Brain.

The purpose of the scoring model is to help AIM: - prioritize the right leads quickly - reduce effort spent on low-fit opportunities - route leads to the right salesperson or escalation path - create a consistent commercial qualification standard across the team - separate exciting leads from actually viable leads

Scoring Design Principles

Score for commercial quality, not just surface interest.

Keep component scores visible; never rely only on one total score.

Distinguish lead attractiveness from execution feasibility.

Penalize missing critical data through completeness and confidence.

Allow founder override, but record it as a learning signal.

35.1 Scoring Model Overview

Total Score = 100

35.2 Fit Score Configuration (0–25)

Objective

Measure how well the lead’s need matches AIM’s services, execution models, and target categories.

Negative Adjustments

Guidance

20–25 = strong fit

14–19 = moderate fit

8–13 = weak fit

below 8 = poor fit or probable misfit

35.3 Authority Score Configuration (0–15)

Objective

Measure whether AIM is speaking to someone who can influence or close the buying decision.

Positive Modifiers

Cap Rule

Authority Score cannot exceed 15.

35.4 Urgency Score Configuration (0–15)

Objective

Measure how time-bound and sales-actionable the opportunity is.

Negative Adjustments

Guidance

Urgency should not overpower feasibility. A rushed but impossible lead is not high-quality.

35.5 Budget Score Configuration (0–15)

Objective

Measure commercial seriousness and likely budget alignment with the probable solution.

Positive Modifiers

Negative Adjustments

Cap Rule

Budget Score cannot exceed 15.

35.6 Completeness Score Configuration (0–10)

Objective

Measure whether enough commercial information exists for meaningful next action.

Critical Fields Considered

service category

campaign objective

target audience

target geography

timeline

scale or sample volume

decision maker status

budget band or budget orientation

Rules

inferred fields contribute less than confirmed fields when calculating completeness confidence

if service category is unknown, completeness cannot exceed 4

if objective is unknown, completeness cannot exceed 5

35.7 Strategic Value Score Configuration (0–10)

Objective

Measure longer-term business value beyond immediate project size.

Rules

Strategic value can increase priority, but cannot override severe feasibility issues.

35.8 Feasibility Score Configuration (0–10)

Objective

Measure whether AIM can realistically execute the requirement as discussed.

Negative Adjustments

Guidance

8–10 = strong feasibility

5–7 = feasible with caution

2–4 = weak feasibility

0–1 = likely not feasible without major clarification

35.9 Confidence Score Configuration (0–100)

Confidence is separate from lead quality.

Objective

Measure how reliable the system’s understanding and recommendations are.

Confidence Inputs

Confidence Bands

80–100 = High Confidence

60–79 = Medium Confidence

Below 60 = Low Confidence

Rules

high-value leads with low confidence should escalate

low confidence should suppress premature proposal-ready status

confidence should drop when fields are contradictory or mostly inferred

35.10 Lead Priority Band Logic

35.11 Routing Rules by Score and Confidence

35.12 SLA Recommendation Rules

35.13 Proposal Readiness Rules Based on Score + Completeness

A lead may be marked:

Ready for Capability Deck

If: - objective known - probable service fit known - target audience known - geography known

Ready for Budgetary Estimate

If: - above capability deck conditions met - timeline band known - scale band or rough volume known - budget orientation known or pilot openness exists

Ready for Scoped Proposal

If: - service/sub-service reasonably clear - geography clear - objective clear - timeline clear - scale clear - budget band known or commercial path agreed - feasibility risk not high - confidence at least medium

Needs Human Review

If: - high value but low confidence - ambiguous service fit - high-risk feasibility - client insists on final quote too early

35.14 Escalation Trigger Rules

Escalate when any of the following is true: - total score >= 80 and confidence < 60 - strategic value score >= 8 and service fit is ambiguous - feasibility score <= 3 but urgency score >= 10 - budget mismatch severe but brand value is high - opportunity spans multiple service lines with unclear primary path - prospect is a marquee account, key founder connection, or board-level contact

35.15 Example Scoring Scenarios

Example A: Strong Skincare Launch Lead

brand manager from known beauty brand

wants Bangalore IT park + mall trial campaign

launch within 30 days

decent budget band disclosed

target audience clear

scale reasonably known

Suggested score: - Fit: 22 - Authority: 11 - Urgency: 12 - Budget: 12 - Completeness: 8 - Strategic: 7 - Feasibility: 7 - Total: 79 - Confidence: 82

Routing: standard qualified priority with fast assignment.

Example B: Marquee Brand, Vague Brief

well-known FMCG brand

asks for “something impactful pan-India”

no budget, no specific audience, no timeline clarity

contact is mid-level marketing executive

Suggested score: - Fit: 15 - Authority: 8 - Urgency: 4 - Budget: 3 - Completeness: 3 - Strategic: 9 - Feasibility: 3 - Total: 45 - Confidence: 42

Routing: founder/sales head review because strategic value is high but clarity is poor.

Example C: Low-Budget Misfit Lead

unknown brand

asks for premium mall activation in multiple cities

budget extremely low and fixed

wants final quote immediately

Suggested score: - Fit: 8 - Authority: 6 - Urgency: 9 - Budget: 1 - Completeness: 5 - Strategic: 2 - Feasibility: 2 - Total: 33 - Confidence: 68

Routing: low priority or disqualify unless client agrees to re-scope.

35.16 Override Rules

Human override should be allowed for: - score correction - strategic value correction - authority correction - feasibility reassessment - routing reassignment

Override Logging Must Capture

who overrode

what changed

why it changed

date/time

logic version originally used

35.17 Recommended Configurability

The following should be admin-configurable: - point values by score band - routing thresholds - SLA thresholds - escalation triggers - strategic account rules - service-specific penalties - proposal readiness gates

35.18 Recommended Next UI Behavior Tied to Scoring

show component scores, not only total score

visually highlight missing critical fields that are reducing score/confidence

display why a score was assigned in plain language

allow human edit for corrected data before score recalculation

clearly show when a high-value lead is being escalated because of low confidence

36. Wireframe Requirements

This section defines the UI structure for the first product version.

The aim is not visual design polish yet. The aim is to make the product buildable by defining the screen structure, information hierarchy, and primary actions.

36.1 Screen: Lead Intelligence Dashboard

Goal

Give sales and leadership a single-pane commercial view of a lead.

Main Sections

Lead Header

Qualification Snapshot

Score and Confidence Panel

Requirement Summary

Missing Information

Recommended Next Step

Solution Recommendation

Case Study Suggestions

Activity Timeline

Layout Suggestion

Left column: lead identity, contact info, company info

Center column: requirement summary, missing data, next questions

Right column: scores, routing, confidence, proposal readiness, escalation flags

Fields to Show

company name

contact name and designation

source channel

service category

sub-service category

industry

target audience summary

geography

timeline band

budget band

total score

component scores

confidence band

proposal readiness

assigned owner

escalation/founder review flag

Key Actions

assign owner

open live discovery assistant

mark as escalate

view recommended case studies

open CRM record

move to proposal stage

log override

Acceptance Criteria

user can understand lead quality in under 30 seconds

user can identify missing critical data without opening another screen

score and confidence are visible at first glance

36.2 Screen: Live Discovery Assistant

Goal

Help salesperson or bot run structured discovery without repetition.

Main Sections

Conversation Stream / Notes

Field Status Tracker

Next-Best Question Suggestions

Captured Answers

Recommendation Preview

Quick Actions

Layout Suggestion

Left panel: transcript or conversation notes

Center panel: structured answer cards and next question suggestions

Right panel: field status, score changes, confidence changes, proposal readiness

Fields to Show

asked questions

skipped questions and reasons

confirmed fields

inferred fields

missing critical fields

next-best questions

current score snapshot

confidence snapshot

Key Actions

ask suggested question

mark answer confirmed

edit field manually

skip question with reason

request founder review

recalculate score

generate summary

Acceptance Criteria

system does not repeat confirmed questions

user can see why the next question is being suggested

score updates after major answer capture

36.3 Screen: Solution Recommendation Panel

Goal

Show the recommended commercial path clearly and explain why it fits.

Main Sections

Primary Recommendation

Alternative Recommendation(s)

Why This Fits

Budget and Timeline Guidance

Risks and Assumptions

Supporting Case Studies

Fields to Show

recommended service mix

recommended touchpoint mix

campaign model (pilot / rollout)

budget band

timeline band

assumptions

exclusions

risks

case study links

Key Actions

accept recommendation

compare alternatives

send to proposal prep

escalate for human review

Acceptance Criteria

user can distinguish recommendation from assumption

user can see at least one reason behind each recommendation

unsupported inactive services are never shown

36.4 Screen: Founder Review Panel

Goal

Allow founder or sales head to quickly correct, approve, or redirect important leads.

Main Sections

Escalation Summary

Lead Snapshot

System Recommendation

Risk / Confidence Indicators

Override Controls

Change Log

Fields to Show

escalation reason

total score and confidence

strategic value score

feasibility score

discovery summary

missing information

recommendation

prior overrides if any

Key Actions

approve recommendation

edit fields

change owner

force proposal stage

mark nurture/disqualify

submit override reason

Acceptance Criteria

founder can make a decision in under 2 minutes for normal escalations

all overrides are logged with reason

system recommendation remains visible alongside override

36.5 Screen: Knowledge Admin Panel

Goal

Allow admin or product team to maintain service logic and question logic.

Main Sections

Services

Industries

Question Banks

Scoring Config

Version History

Case Study Tags

Key Actions

create/edit/archive service

update question conditions

update scoring thresholds

activate new version

rollback version if needed

Acceptance Criteria

admin can update active logic without breaking historical records

version history is visible and searchable

only approved users can publish logic changes

36.6 Cross-Screen Design Requirements

Required Global UI Elements

lead score chip

confidence chip

proposal readiness chip

source channel badge

escalation badge

last updated timestamp

logic version indicator

Required Behaviors

every important AI-generated field should be traceable

human-edited fields should show override marker

screen should clearly separate confirmed vs inferred data

critical missing fields should be visually highlighted

36.7 Recommended Prototype Order

Build wireframes/prototypes in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel

This order matches the sequence of highest business value for AIM.

36.8 Recommended Next Document

After this scoring sheet and wireframe spec, the next most useful document is: API Contract + Event Schema + Pilot Rollout Plan

That will give engineering integration clarity and give leadership a phased implementation path.

37. API Contract Specification

This section defines the recommended API surface for AIM Entity Brain.

The API layer should support: - lead intake - discovery progression - scoring - recommendation generation - CRM sync - founder override - analytics and audit retrieval

API Design Principles

Keep business objects explicit and versioned.

Separate synchronous response APIs from event-driven workflow updates.

Ensure all AI-generated outputs can be traced to model version and logic version.

Use structured request and response bodies.

Keep human override endpoints first-class, not as afterthoughts.

Base Objects

Lead

Discovery Session

Discovery Answer

Score Snapshot

Recommendation Snapshot

CRM Sync Result

Override Record

Outcome Record

Knowledge Version

37.1 API Authentication and Access Model

Recommended Access Types

Internal Service Token for backend-to-backend integrations

Role-based User Auth for admin, sales, founder, ops, CRM admin

Channel Auth for website bot, WhatsApp connector, and later voice stack

Recommended Roles

Admin

Sales User

Sales Head

Founder Reviewer

Ops User

CRM Admin

Read-Only Analytics User

Authorization Rules

Sales users can read and update assigned leads and discovery sessions

Founders and sales heads can override recommendations and scores

Admins can update knowledge logic, scoring thresholds, and service records

CRM Admins can manage sync configuration and duplicate detection rules

37.2 Lead Intake API

Endpoint

POST /api/v1/leads/intake

Purpose

Create or update an incoming lead from website, WhatsApp, email, phone, or manual entry.

Request Body

{
"source_channel": "website",
"lead_origin_type": "inbound",
"company_name": "Example Brand",
"contact_name": "Priya Sharma",
"designation": "Brand Manager",
"email": "priya@example.com",
"phone": "+919999999999",
"raw_message": "We want to do a skincare sampling campaign in Bangalore.",
"campaign_source": "google_ads",
"campaign_medium": "cpc",
"campaign_name": "sampling_q2"
}

Response Body

{
"lead_id": "LD-000124",

"matched_existing_lead": false,
"discovery_session_id": "DS-00987",
"classification_status": "pending",
"message": "Lead intake successful"
}

Rules

duplicate detection should run before creating a new lead

if confidence of duplicate match is high, update existing lead instead of creating new one

raw inbound message should be stored separately from structured summary

37.3 Lead Classification API

Endpoint

POST /api/v1/leads/{lead_id}/classify

Purpose

Classify service category, industry, probable objective, and priority context from existing lead data.

Response Body

{
"lead_id": "LD-000124",
"industry_primary": "Beauty / Skincare",
"service_category": "Product Sampling",
"sub_service_category": "IT Park Sampling",
"campaign_objective_primary": "Product Trial",
"confidence_score": 74,
"logic_version_used": "v1.0.3",
"model_version_used": "gpt-x.x"
}

Rules

classification should always preserve confidence and origin metadata

if classification confidence is low, discovery should remain broad until clarified

37.4 Discovery Session Create API

Endpoint

POST /api/v1/discovery-sessions

Purpose

Create a structured discovery session tied to a lead.

Request Body

{
"lead_id": "LD-000124",
"channel": "sales_copilot",
"initiated_by": "sales_user_17"
}

Response Body

{
"discovery_session_id": "DS-00987",
"lead_id": "LD-000124",
"status": "active"
}

37.5 Next-Best Question API

Endpoint

GET /api/v1/discovery-sessions/{discovery_session_id}/next-question

Purpose

Return the most relevant next question based on current field state.

Response Body

{
"question_id": "Q-112",
"question_text": "Approximately how many samples are you planning to deploy in phase 1?",
"question_type": "Quote Critical",
"reason": "Sample volume is required to estimate campaign scope and budget band.",
"field_to_populate": "sample_volume_estimate",
"priority": 1
}

Rules

must not return a question already confirmed unless clarification flag exists

should include plain-language reason so the salesperson understands why it matters

37.6 Discovery Answer Capture API

Endpoint

POST /api/v1/discovery-sessions/{discovery_session_id}/answers

Purpose

Capture a prospect answer and update structured fields.

Request Body

{
"question_id": "Q-112",
"answer_text": "We are planning around 10,000 units for the first phase.",
"captured_by": "sales_user_17",
"answer_source": "human_entered"
}

Response Body

{
"lead_id": "LD-000124",
"updated_fields": [
{
"field": "sample_volume_estimate",
"value": 10000,
"status": "confirmed"
}
],
"score_recalculated": true,
"proposal_readiness_status": "Ready for Budgetary Estimate"
}

Rules

every captured answer should generate field updates, audit records, and optional score recalculation

AI-normalized values should preserve original answer text for traceability

37.7 Discovery Summary API

Endpoint

GET /api/v1/leads/{lead_id}/discovery-summary

Purpose

Return a structured summary of all known, inferred, and missing commercial information.

Response Body

{
"lead_id": "LD-000124",
"summary": "Beauty brand exploring Bangalore IT park sampling for skincare launch within 30 days.",
"confirmed_fields": {
"industry_primary": "Beauty / Skincare",

"service_category": "Product Sampling",

"sample_volume_estimate": 10000

},

"inferred_fields": {

"budget_band": "3L–10L"

},

"missing_fields": [

"exact touchpoint split",

"branding scope"

]

}

37.8 Score Calculation API

Endpoint

POST /api/v1/leads/{lead_id}/score

Purpose

Recalculate all component scores and total lead score.

Response Body

{

"lead_id": "LD-000124",

"fit_score": 22,

"authority_score": 11,

"urgency_score": 12,

"budget_score": 10,

"completeness_score": 8,

"strategic_value_score": 6,

"feasibility_score": 7,

"total_lead_score": 76,

"lead_priority_band": "Qualified Priority",

"confidence_score": 81,

"confidence_band": "High"

}

Rules

every scoring response must include component-level outputs

score recalculation should happen automatically after critical field changes and optionally on demand

37.9 Recommendation API

Endpoint

POST /api/v1/leads/{lead_id}/recommendation

Purpose

Generate service, touchpoint, and next-step recommendation.

Response Body

{
"lead_id": "LD-000124",
"recommended_service_mix": [
"IT Park Sampling",
"Mall Sampling"
],
"recommended_campaign_model": "Pilot",
"budget_band": "3L–10L",
"timeline_band": "Within 30 Days",
"recommended_case_studies": [
"CS-101",
"CS-117"
],
"risks": [
"Branding scope not yet defined"
],
"assumptions": [
"Single-city phase 1"
]
}

Rules

should not generate unsupported service recommendations

must preserve assumptions explicitly

low confidence recommendations should include human review flag

37.10 Proposal Readiness API

Endpoint

GET /api/v1/leads/{lead_id}/proposal-readiness

Purpose

Return readiness status for capability deck, budgetary estimate, or scoped proposal.

Response Body

{

"lead_id": "LD-000124",

"proposal_readiness_status": "Ready for Budgetary Estimate",

"quote_readiness_status": "Needs More Discovery",

"missing_critical_fields": [

"branding scope"

],

"recommended_next_action": "Clarify branding requirement before final proposal"

}

37.11 CRM Sync API

Endpoint

POST /api/v1/leads/{lead_id}/sync-crm

Purpose

Push or update lead intelligence in CRM.

Response Body

{

"lead_id": "LD-000124",

"crm_record_id": "CRM-77812",

"sync_status": "success",

"updated_fields_count": 21,

"owner_assigned": "Vidhya",

"sla_priority": "High"

}

Rules

all sync attempts should create audit records

CRM sync failures should create retryable system events

37.12 Founder Override API

Endpoint

POST /api/v1/leads/{lead_id}/override

Purpose

Allow founder or sales head to modify scores, routing, service recommendations, or readiness states.

Request Body

{
"override_type": "service_correction",
"changed_fields": {
"sub_service_category": "Mall Sampling"
},
"reason": "Better TG fit for premium skincare positioning",
"overridden_by": "founder_user_01"
}

Response Body

{
"lead_id": "LD-000124",
"override_record_id": "OV-6612",
"status": "applied",
"learning_signal_created": true
}

Rules

all overrides must capture before/after values and reason

override should trigger refreshed summary and optional re-score

37.13 Outcome Logging API

Endpoint

POST /api/v1/leads/{lead_id}/outcome

Purpose

Store win/loss and outcome reason for learning and analytics.

Request Body

{
"outcome_status": "won",
"outcome_reason": "Budget aligned and pilot approved",
"recorded_by": "sales_head_01"
}

37.14 Knowledge Management APIs

Recommended Endpoints

POST /api/v1/knowledge/services

PATCH /api/v1/knowledge/services/{service_id}

POST /api/v1/knowledge/questions

PATCH /api/v1/knowledge/questions/{question_id}

POST /api/v1/knowledge/industries

POST /api/v1/knowledge/case-studies

POST /api/v1/knowledge/versions/publish

POST /api/v1/knowledge/versions/rollback

Rules

only approved roles can publish new logic version

version metadata must be preserved on all production decisions

37.15 Analytics APIs

Recommended Endpoints

GET /api/v1/analytics/lead-quality

GET /api/v1/analytics/question-quality

GET /api/v1/analytics/override-patterns

GET /api/v1/analytics/conversion-by-score-band

GET /api/v1/analytics/discovery-completeness

37.16 Error Handling Standards

Common Error Types

validation_error

duplicate_lead_conflict

knowledge_version_not_found

low_confidence_block

crm_sync_failure

permission_denied

unsupported_service_path

Error Response Format

```
{
"error_code": "validation_error",
"message": "service_category is required for scoring",
"details": {
"field": "service_category"
}
}
```

38. Event Schema Specification

This section defines the event-driven model for AIM Entity Brain.

The event layer should power: - auditability - retries - analytics - downstream integrations - async workflow automation

Event Design Principles

Every material lead-state change should emit an event.

Events should be idempotent-friendly.

Events should include source, timestamp, lead ID, and version metadata.

Failure-prone external integrations should be event-driven where possible.

Standard Event Envelope

```
{
"event_id": "EV-90001",
"event_type": "lead.created",
"occurred_at": "2026-04-04T12:15:00Z",
"lead_id": "LD-000124",
"source": "website_bot",
"logic_version_used": "v1.0.3",
"model_version_used": "gpt-x.x",
"payload": {}
}
```

38.1 Core Lead Events

lead.created

When a new lead record is created.

lead.updated

When major lead data is updated.

lead.matched_existing

When intake resolves to an existing lead rather than creating a new one.

lead.assigned

When owner/team assignment occurs.

lead.escalated

When founder or sales-head review is triggered.

lead.disqualified

When lead is marked low-fit or unviable.

38.2 Discovery Events

discovery.started

When a discovery session begins.

discovery.question.served

When next-best question is generated and shown.

discovery.answer.captured

When an answer is stored.

discovery.field.updated

When a structured field changes.

discovery.summary.generated

When a summary is refreshed.

discovery.completed

When minimum discovery threshold is reached.

38.3 Scoring and Recommendation Events

score.calculated

When score snapshot is recalculated.

confidence.updated

When confidence changes materially.

recommendation.generated

When solution recommendation is produced.

proposal.readiness.changed

When readiness status changes.

38.4 CRM and Workflow Events

crm.sync.requested

When CRM sync is triggered.

crm.sync.succeeded

When CRM sync succeeds.

crm.sync.failed

When CRM sync fails.

task.created

When follow-up or review task is created.

sla.priority.changed

When SLA classification changes.

38.5 Human Review Events

override.created

When a founder or sales head override is submitted.

override.applied

When override has been written into active lead state.

review.approved

When escalation is approved without changes.

review.reassigned

When ownership or path is changed in review.

38.6 Learning and Outcome Events

outcome.recorded

When win/loss is captured.

analytics.snapshot.generated

When periodic analytics jobs are run.

knowledge.version.published

When new logic goes live.

knowledge.version.rolled_back

When version rollback happens.

38.7 Example Event Payloads

Example: score.calculated

```
{
"event_id": "EV-90002",
"event_type": "score.calculated",
"occurred_at": "2026-04-04T12:30:00Z",
"lead_id": "LD-000124",
"source": "scoring_engine",
"logic_version_used": "v1.0.3",
"payload": {
"fit_score": 22,
"authority_score": 11,
"urgency_score": 12,
"budget_score": 10,
"completeness_score": 8,
"strategic_value_score": 6,
"feasibility_score": 7,
"total_lead_score": 76,
"lead_priority_band": "Qualified Priority"
}
```

}

Example: lead.escalated

{

"event_id": "EV-90003",

"event_type": "lead.escalated",

"occurred_at": "2026-04-04T12:35:00Z",

"lead_id": "LD-000124",

"source": "orchestrator",

"payload": {

"reason": "High value but low confidence",

"recommended_reviewer_role": "Founder Reviewer"

}

}

38.8 Event Consumers

Recommended Consumers

CRM integration worker

analytics worker

notification service

founder review queue service

task creation service

audit log service

model evaluation pipeline

38.9 Retry and Failure Handling

Recommended Rules

CRM sync failures should retry with backoff

external messaging failures should be logged and retried separately

score/recommendation failures should not corrupt existing lead state

failed async consumers should push to dead-letter queue after retry threshold

39. Pilot Rollout Plan

This section defines how AIM should launch the first working version of Entity Brain.

The goal is not to automate everything at once. The goal is to prove business value safely and quickly.

Pilot Principles

Start with high-frequency, commercially important services.

Use internal sales copilot first.

Keep founder feedback tightly looped during the pilot.

Measure both system accuracy and business impact.

Expand only after question quality and routing quality stabilize.

39.1 Recommended Pilot Scope

Phase 1 Pilot Services

Start with the services that most directly affect AIM's current commercial motion: 1. Product Sampling - IT Park Sampling - RWA / Apartment Sampling - Mall Sampling - In-Store / Retail Sampling 2. Brand Activation - Kiosk-Based Activation - Product Demo / Trial Booth 3. Transit / Mobile Outreach - LED Van Campaign

Why These First

they are core to AIM's sales motion

they have repeatable commercial logic

they frequently require founder intervention today

they are good training ground for discovery quality

39.2 Recommended Pilot Users

Internal Users

1 Sales Head / reviewer

2 Sales users

1 Founder reviewer

1 Ops reviewer

1 Product / admin owner

Suggested AIM Pilot Roles

Sales Head: oversight and override review

Sales Users: primary copilot users during discovery

Founder: weekly quality review and escalations

Ops: feasibility validation feedback

Admin/Product: maintain knowledge updates and scoring thresholds

39.3 Recommended Pilot Channels

Start With

manual lead entry through sales copilot

website inbound leads summarized into system

WhatsApp inbound leads processed through structured intake

Defer Initially

fully autonomous public chatbot

voice outbound automation

automated proposal generation without review

39.4 Pilot Success Criteria

Operational Success Metrics

reduction in founder interruptions per lead

increase in discovery completeness score

reduction in average time to proposal readiness

reduction in missing critical fields at proposal stage

Quality Metrics

duplicate question rate below agreed threshold

score accuracy vs sales-head review

recommendation usefulness rating from sales team

feasibility flag accuracy from ops review

Commercial Metrics

improved lead prioritization quality

faster response on high-intent leads

improved proposal conversion on qualified leads

39.5 Pilot KPI Targets (Recommended Starting Benchmarks)

These can be tuned once AIM sets a baseline.

39.6 Pilot Rollout Stages

Stage 0: Preparation (Week 1–2)

finalize pilot services

finalize scoring thresholds

finalize question banks

finalize CRM field map

onboard pilot users

define feedback review cadence

Stage 1: Internal Copilot Shadow Mode (Week 3–4)

sales team continues normal process

system runs in parallel and suggests questions/scores

compare system suggestions against actual sales actions

log gaps and override patterns

Stage 2: Assisted Live Mode (Week 5–6)

sales team actively uses copilot during discovery

founder reviews escalated leads

ops validates feasibility flags

CRM sync used for pilot leads

Stage 3: Controlled Operational Mode (Week 7–8)

selected website and WhatsApp leads enter through system

discovery summaries auto-generated

scoring/routing used for working decisions

weekly logic tuning based on outcomes

Stage 4: Pilot Review and Expansion Decision (Week 9)

review business metrics

review override patterns

review question quality

review routing accuracy

decide go/no-go for discovery bot expansion

39.7 Pilot Governance Cadence

Daily

review sync failures

review escalations

review major overrides

Weekly

founder review of top escalations

sales feedback review

ops feedback review

scoring and question quality review

End of Pilot

compare baseline vs pilot performance

identify service gaps

finalize phase 2 expansion plan

39.8 Recommended Pilot Review Template

Each week, review: - number of pilot leads processed - score distribution - confidence distribution - average completeness score - number of escalations - number of overrides - most common missing fields - most common weak questions - most common misclassification issues - proposal-readiness accuracy - notable wins/losses

39.9 Expansion Criteria After Pilot

Expand to next phase only if: - discovery quality is stable - duplicate questioning is low - sales users trust the copilot - founder override rate is reducing meaningfully - CRM sync reliability is acceptable

- recommendation usefulness is consistently positive

Phase 2 Expansion Candidates

more retail branding workflows

more hybrid campaign paths

customer-facing discovery bot

Phase 3 Expansion Candidates

voice prospecting engine

semi-automated outbound qualification

deeper proposal automation

39.10 Recommended Ownership Model

39.11 Recommended Next Document

After this implementation specification, the next best documents are: 1. Figma wireframes or clickable prototype for the key screens 2. Engineering task breakdown by module 3. Data migration / knowledge ingestion plan 4. Pilot operating SOP for sales and founder reviewers

These will take AIM from planning into active build execution.

40. Engineering Task Breakdown by Module

This section translates the product specification into executable workstreams for engineering, product, and operations.

The purpose of this breakdown is to help AIM: - estimate build effort - allocate ownership across backend, frontend, product, and integrations - sequence the build properly - avoid building UI before core logic and data structures exist

Workstream Design Principles

Build core data and logic before advanced UI.

Separate platform foundations from user-facing features.

Deliver the internal sales copilot first.

Keep every workstream testable in isolation.

Treat knowledge quality as a product dependency, not just content work.

40.1 Workstream Overview

40.2 Workstream 1: Platform Foundation

Objective

Create the underlying application infrastructure needed for secure, traceable, versioned operations.

Key Tasks

set up environments: dev, staging, production

implement auth and RBAC

define core database schema

set up audit logging framework

set up file/retrieval storage connectors

set up event bus / queue mechanism

define API versioning approach

implement observability basics (logs, metrics, errors)

Deliverables

environment setup checklist

RBAC matrix

initial database schema migrations

logging and monitoring setup

API gateway/base framework

Dependencies

none, this starts first

Acceptance Criteria

authenticated internal users can access system based on role

all API calls are logged with user/service identity

core objects can be persisted in database

40.3 Workstream 2: Knowledge Core Implementation

Objective

Build the structured knowledge layer and admin-ready data foundations.

Key Tasks

implement services table and CRUD APIs

implement sub-services table and relationships

implement industry playbook table and CRUD APIs

implement discovery question table with conditional fields

implement case-study metadata model

implement scoring config tables

implement knowledge versioning model

build import templates for structured data uploads

Deliverables

service and sub-service APIs

question bank APIs

industry playbook APIs

case-study metadata APIs

versioning schema

admin import template sheets

Dependencies

Platform Foundation

Acceptance Criteria

admin can create and retrieve structured service and question records

knowledge version can be tagged and retrieved by live engine

inactive knowledge does not appear in live recommendations

40.4 Workstream 3: Retrieval and Knowledge Access Layer

Objective

Enable the system to fetch relevant long-form context such as case studies, SOPs, and proposal archives.

Key Tasks

define retrieval corpus types

build document ingestion pipeline for approved files

tag documents with service/industry metadata

implement retrieval APIs

support filtered retrieval by service, industry, geography, and objective

store retrieval trace metadata alongside outputs

Deliverables

retrieval corpus structure

metadata schema

filtered retrieval endpoint

retrieval trace logging

Dependencies

Platform Foundation

Knowledge Core

Acceptance Criteria

system can retrieve relevant case studies based on service and industry filters

retrieval results include source metadata for auditability

40.5 Workstream 4: Orchestration Engine

Objective

Build the decision layer that runs classification, questioning, scoring, and recommendations.

Key Tasks

implement lead classification service

implement field-state manager

implement next-best-question selector

implement duplicate-question prevention logic

implement scoring engine

implement confidence engine

implement recommendation engine

implement proposal-readiness engine

implement escalation rules

Deliverables

orchestrator service

field-state logic

question selection service

scoring service

recommendation service

readiness service

Dependencies

Knowledge Core

Retrieval Layer

CRM field mapping

Acceptance Criteria

system can generate next-best question based on lead state

score updates when critical fields change

recommendation output includes assumptions and risks

low-confidence high-value leads escalate correctly

40.6 Workstream 5: Lead and Discovery APIs

Objective

Expose the engine through stable APIs for UI and integrations.

Key Tasks

build lead intake endpoint

build lead classification endpoint

build discovery session create endpoint

build answer capture endpoint

build score and recommendation endpoints

build proposal-readiness endpoint

build override endpoint

build outcome logging endpoint

Deliverables

API contracts implemented

API validation layer

API error handling and response standards

Dependencies

Orchestration Engine

Platform Foundation

Acceptance Criteria

all critical API flows work in staging

APIs return structured objects matching the contract spec

validation errors are explicit and recoverable

40.7 Workstream 6: CRM & Workflow Integration

Objective

Push lead intelligence into CRM and trigger assignment/action workflows.

Key Tasks

implement CRM create/update sync

implement duplicate lead handling logic

implement owner assignment rules

implement task creation rules

implement SLA tagging

implement sync retry handling and error logging

implement event-triggered workflow updates

Deliverables

CRM sync service

workflow task service

owner assignment engine

SLA priority logic

Dependencies

Lead and Discovery APIs

Event Schema

CRM field mapping

Acceptance Criteria

pilot leads sync into CRM with mapped structured fields

sync failures are logged and retryable

owner assignment follows routing rules

40.8 Workstream 7: Sales Copilot Frontend

Objective

Create the primary working interface for internal sales usage.

Key Tasks

build Lead Intelligence Dashboard UI

build Live Discovery Assistant UI

build score/confidence panels

build missing-field tracker UI

build summary and recommendation cards

build action buttons for assign, escalate, rescore, sync

Deliverables

sales copilot screens

responsive layouts for desktop use

state management for live discovery

Dependencies

Lead and Discovery APIs

scoring and recommendation outputs

Acceptance Criteria

salesperson can complete a structured discovery flow from one interface

UI shows confirmed vs inferred vs missing fields clearly

next-best question can be used during live calls

40.9 Workstream 8: Founder Review Frontend

Objective

Create the escalation review and override interface.

Key Tasks

build review queue screen

build Founder Review Panel

build override form and reason capture

build before/after comparison UI

build override history display

Deliverables

founder review queue

override interaction flow

audit-friendly change display

Dependencies

override APIs

score and recommendation APIs

Acceptance Criteria

founder can review and override an escalated lead quickly

every override is captured with reason and before/after state

40.10 Workstream 9: Knowledge Admin Frontend

Objective

Allow controlled maintenance of services, questions, scoring, and knowledge versions.

Key Tasks

build service management screens

build industry playbook screens

build question-bank editor

build scoring config editor

build publish/rollback version controls

build case-study metadata management interface

Deliverables

admin console for knowledge updates

publish and rollback workflow

Dependencies

Knowledge Core APIs

auth and role controls

Acceptance Criteria

authorized admin can update logic without engineering support

published logic version is visible to live engine and audit logs

40.11 Workstream 10: Analytics, Audit, and Evaluation

Objective

Measure system quality and pilot business impact.

Key Tasks

build lead-quality analytics

build override analytics

build discovery completeness analytics

build question-quality analytics

build conversion-by-score dashboards

build audit trail views

implement model trace storage for major decisions

Deliverables

pilot analytics dashboard

audit export/reporting capability

quality monitoring views

Dependencies

event schema

outcome logging

overrides

Acceptance Criteria

pilot team can review weekly quality and impact metrics

every major decision state has trace metadata available

40.12 Workstream 11: QA, Testing, and Evaluation Harness

Objective

Validate that the system behaves reliably across real AIM scenarios.

Key Tasks

create scenario test library by service and industry

create expected-answer and expected-question test cases

build regression checks for score/routing logic

build duplicate-question test set

build misfit lead test set

run founder-reviewed evaluation cycles

Deliverables

scenario library

acceptance test checklist

regression test suite

pilot issue triage template

Dependencies

all major modules

Acceptance Criteria

core scenarios pass acceptance checks before live pilot expansion

repeated regressions are visible before release

40.13 Suggested Sprint-Level Build Sequence

Sprint A

Platform Foundation

base database schema

auth and roles

event envelope setup

Sprint B

Knowledge Core APIs

import templates

service and question models

Sprint C

Orchestration basics

classification

field-state tracking

next-best question service

Sprint D

scoring engine

confidence engine

recommendation engine

readiness engine

Sprint E

lead/discovery APIs

CRM sync basics

owner assignment

Sprint F

Sales Copilot UI

Lead Intelligence Dashboard

Live Discovery Assistant

Sprint G

Founder Review UI

override flow

analytics basics

Sprint H

hardening, QA, pilot support, weekly logic tuning

40.14 Resourcing Recommendation

Minimum Practical Product Team

1 Product Owner / Product Manager

1 Backend Engineer

1 Frontend Engineer

1 Full-stack or Integration Engineer

1 QA / Test Engineer (shared is acceptable initially)

1 Knowledge Ops / Product Admin

1 Founder / Sales Head reviewer for weekly logic tuning

Optional but Valuable

1 AI / Prompt / Eval specialist

1 Data analyst for pilot measurements

40.15 Build Risk Notes

Likely Risk Areas

weak initial knowledge quality

over-complex orchestration too early

CRM sync mismatch with existing workflow

sales UI becoming too heavy for live usage

lack of consistent override reviews

Recommended Mitigation

keep pilot scope narrow

build observable state and logs first

tune on real lead scenarios weekly

keep human override easy and visible

41. Knowledge Ingestion Plan

This section defines how AIM should convert existing founder knowledge, case studies, service know-how, and past assets into usable Entity Brain knowledge.

The goal is to avoid a common failure mode: uploading lots of documents but not creating usable decision intelligence.

Ingestion Principles

Do not treat raw documents as the final brain.

Normalize critical knowledge into structured entities.

Preserve source links and provenance for every ingested fact.

Separate evergreen logic from temporary campaign-specific data.

Use founder review to validate the first structured versions.

41.1 Knowledge Source Categories

Structured Knowledge Sources

service lists

pricing frameworks

deliverable templates

approval matrices

routing rules

scoring rules

CRM fields

Semi-Structured Sources

proposals

SOWs

capability decks

case study decks

service one-pagers

questionnaire sheets

Unstructured Sources

founder voice notes or explanations

call transcripts

WhatsApp discussions

email threads

internal notes

meeting summaries

Operational Sources

execution SOPs

permission notes

city-level constraints

staffing assumptions

turnaround benchmarks

41.2 What Must Be Structured First

The first structured ingestion wave should prioritize: 1. services and sub-services 2. discovery questions 3. quote-critical inputs 4. feasibility-critical inputs 5. scoring logic 6. routing rules 7. high-value case studies 8. common objections and good responses

This is more important than bulk-importing every old document.

41.3 Ingestion Pipeline Stages

Stage 1: Inventory

Collect and list all existing knowledge assets.

Tasks

create source inventory spreadsheet

identify owner of each source

classify source type

tag source freshness

tag source business relevance

Output

A master inventory of AIM knowledge assets.

Stage 2: Prioritization

Decide what should be ingested first.

Priority Order

high-frequency services

current sales-useful documents

repeatable pricing and discovery logic

proven case studies

founder explanations of nuanced commercial decisions

Output

Ingestion priority backlog.

Stage 3: Extraction

Extract commercially relevant facts and patterns from sources.

Tasks

identify service definitions

identify required questions

identify pricing drivers

identify feasibility dependencies

identify common misfit cases

identify objections and winning pitch angles

identify scoring signals

Output

Raw extracted insight sheets by source.

Stage 4: Normalization

Convert extracted insights into structured objects.

Convert Into

service records

question bank records

case-study records

scoring config records

objection records

proposal module records

feasibility notes

Output

Structured import-ready data.

Stage 5: Validation

Have founder / sales head / ops validate structured data.

Validation Focus

is this commercially true?

is anything important missing?

is this outdated?

does this apply generally or only in specific cases?

Output

Approved version 1 structured knowledge pack.

Stage 6: Publication

Push approved knowledge to live/staging environment.

Output

Published knowledge version with changelog.

41.4 Knowledge Inventory Template

Recommended Columns

source_id

source_name

source_type

owner

service_tags

industry_tags

document_date

current_relevance

ingestion_priority

status

notes

Recommended Status Values

Not Reviewed

Prioritized

Extracted

Normalized

Validated

Published

Archived

41.5 Founder Knowledge Capture Plan

A large part of AIM’s advantage lives in founder reasoning, not documents.

Recommended Capture Methods

structured founder interviews by service

scenario-based workshops

win/loss debrief capture

proposal review deconstruction

override explanation logging during pilot

Best Format for Capture

For each service, ask founders to explain: - when this service is the right fit - when it is the wrong fit - what questions they ask first - what information they must know before quoting - what usually goes wrong - what makes a lead exciting but risky - what they would recommend instead in edge cases

Output

Founder reasoning sheets that can be normalized into rules and question banks.

41.6 Service-by-Service Ingestion Template

For each active service, capture the following: - service name - service description - ideal use cases - non-ideal use cases - best-fit industries - key target audiences - mandatory quote inputs - mandatory feasibility inputs - pricing drivers - common objections - recommended pitch angles - supporting case studies - risk notes - common substitutions or alternatives

This template should be completed before activating a service in pilot scope.

41.7 Case Study Ingestion Template

For each case study, capture: - case_study_id - client category - industry - service used - objective - target audience - geography - campaign scale - execution summary - outcome/result - lessons learned - where this case study is useful in sales - proof assets available

Important Rule

Do not store case studies only as PDFs or slides. Create metadata and structured tags first.

41.8 Proposal and SOW Ingestion Guidance

Past proposals and SOWs are valuable, but they should not be imported blindly.

Extract Only

service scope patterns

exclusions patterns

pricing drivers

deliverable blocks

assumptions patterns

client-specific modifications

Do Not Reuse Blindly

outdated pricing

one-off exceptional commercial concessions

old timelines that no longer reflect ops reality

custom clauses from unusual clients unless explicitly tagged

41.9 Objection and Pitch-Angle Ingestion Plan

The Entity Brain should know not just what AIM sells, but how AIM sells it.

Extract and Structure

common objections by service

common objections by industry

strong responses that work

proof points needed to support the response

when to shift to pilot-first recommendation

when to reposition the service mix

Example Tags

budget objection

timeline objection

feasibility objection

“why this touchpoint” objection

attribution objection

trust / credibility objection

41.10 Ops and Feasibility Knowledge Ingestion

This is critical so sales logic stays grounded.

Capture

permission dependencies by touchpoint

lead-time norms by service

production/fabrication constraints

manpower assumptions

city-specific constraints

compliance or handling considerations

reporting limitations

Why It Matters

Without this layer, the brain will oversell and under-warn.

41.11 Suggested Ingestion Sequence for AIM

Wave 1: Pilot-Critical Knowledge

Product Sampling

IT Park Sampling

RWA Sampling

Mall Sampling

In-Store Sampling

Kiosk Activation

LED Van

related case studies

related objections

related feasibility notes

Wave 2: Expansion Knowledge

retail branding

hybrid solutions

workplace activation variants

college and gym expansions

Wave 3: Advanced Learning Knowledge

call transcripts

win/loss notes

founder override logs

response quality patterns

41.12 Ingestion Roles and Ownership

41.13 Quality Checks for Ingested Knowledge

Before publishing a knowledge pack, confirm: - the service definition is current - the question set is not repetitive - quote inputs are sufficient but not excessive - feasibility notes are grounded in real ops constraints - case-study tags are accurate - scoring signals are commercially sensible -

outdated pricing or one-off exceptions are excluded or clearly tagged

41.14 Knowledge Freshness Policy

Recommended Review Frequency

service logic: monthly or when service changes

pricing drivers: monthly or on commercial change

case studies: as new ones become available

feasibility rules: whenever ops constraints change

scoring logic: weekly during pilot, then monthly

Freshness Labels

Current

Needs Review

Archived

Historical Reference Only

41.15 Recommended First 30-Day Ingestion Plan

Week 1

build source inventory

prioritize pilot services

define ingestion templates

Week 2

extract and normalize pilot service logic

capture founder reasoning for pilot services

capture top 10–20 questions per pilot service

Week 3

ingest top case studies and objections

ingest feasibility constraints

validate with founder and ops

Week 4

publish v1 knowledge pack

begin pilot usage

start override-driven refinement cycle

41.16 Common Ingestion Mistakes to Avoid

uploading decks without extracting structured logic

mixing outdated and current pricing assumptions

storing founder insights only in free-text notes

failing to distinguish service rules from client-specific exceptions

skipping ops validation

activating too many services before the pilot logic is stable

41.17 Recommended Next Document

After this engineering breakdown and knowledge ingestion plan, the next strongest documents are: 1. Pilot Operating SOP for Sales, Founder Review, and Ops 2. Figma wireframe prompt / UI spec for prototype creation 3. Engineering estimation sheet by workstream and sprint

These will move AIM from planning into execution governance.

42. Pilot Operating SOP

This section defines how AIM should operate the Entity Brain during the pilot.

The purpose of this SOP is to ensure that the pilot is not treated as only a software test. It must function as an operating system test across sales, founder review, ops validation, and product/admin tuning.

SOP Principles

Sales should use the copilot during real discovery, not only after the call.

Founder review should focus on high-value ambiguity, not routine lead handling.

Ops should validate feasibility signals before overpromising becomes a pattern.

Every override and correction should improve the system.

Weekly review must convert pilot observations into logic updates.

42.1 Pilot Roles and Responsibilities

42.2 Daily Operating Flow

Step 1: Lead Intake

All pilot leads should enter through one of these routes: - direct intake into sales copilot - website lead synced into system - WhatsApp inquiry entered or connected into system

Sales User Action

open or create lead in system

review initial classification

confirm obvious identity details

start discovery session

System Action

create or update lead

classify probable service and industry

begin discovery state

suggest next-best question

42.3 Sales Discovery SOP

When to Use Copilot

Sales should use the copilot during: - first discovery call - WhatsApp clarification chat - email-based requirement clarification - follow-up call before proposal preparation

Sales User Must Do

review the lead summary before speaking

ask suggested questions where relevant

mark answers as confirmed when prospect states them clearly

correct inferred fields if needed

avoid skipping critical questions without reason

check proposal-readiness before asking for internal pricing/proposal prep

Sales User Must Not Do

ignore missing critical fields and still request final proposal

override recommendation without reason

assume inferred fields are confirmed facts

promise feasibility where the system has flagged risk without validation

Minimum Sales Checklist Before Moving Lead Forward

objective captured

target audience captured

geography captured

timeline captured in at least band form

service direction reasonably clear

budget orientation captured or at least discussed

major feasibility blockers flagged if known

42.4 Founder Review SOP

When a Lead Must Be Escalated

Escalate when: - score is high but confidence is low - lead is strategically valuable or marquee - service fit is ambiguous across multiple AIM services - client is pushing for final pricing without enough discovery - feasibility risk is high due to timeline, permissions, or category sensitivity - salesperson is unable to determine commercial direction confidently

Founder Reviewer Must Do

review system summary, score, confidence, and missing fields

assess whether the issue is discovery quality, service fit, or feasibility

approve, edit, or override the system recommendation

record override reason in clear business language

identify whether logic update is needed for similar future cases

Founder Reviewer Must Not Do

rewrite the whole brief without preserving why the system was wrong

bypass logging because the lead seems obvious

let urgent but low-feasibility leads proceed without caution notes

Target Review Time

For standard escalations, founder review should ideally be completed in a short focused window, with a practical goal of rapid turnaround during business hours.

42.5 Ops Validation SOP

When Ops Should Be Involved

Ops should validate when: - permissions are a likely blocker - timeline is aggressive - product handling/storage requirements are unclear - branding/fabrication scope affects feasibility - multi-touchpoint complexity is high - retail or venue approvals are required

Ops Reviewer Must Do

review the relevant lead summary and risk flags

confirm or correct feasibility assumptions

identify hidden ground constraints

flag unrealistic commitments before proposal stage

suggest safer execution model where needed

Ops Reviewer Output

feasible

feasible with caution

not feasible without changes

needs more information

This output should be captured in system notes and reflected in feasibility score updates.

42.6 Sales Head Monitoring SOP

Sales Head Responsibilities

review the day’s high-priority leads

review leads stuck in discovery too long

monitor whether sales team is using the copilot properly

review major override patterns

identify where training vs logic improvement is needed

Daily Review Focus

high-priority leads not yet assigned

high-score leads with missing critical fields

repeated founder escalations of the same kind

low-confidence recommendations on important leads

42.7 Product/Admin Operating SOP

Daily Responsibilities

review system errors

review CRM sync failures

review duplicate lead issues

review major logic failures reported by users

track unresolved pilot bugs

Weekly Responsibilities

prepare pilot metrics summary

prepare top override patterns

prepare top weak-question patterns

prepare top misclassification patterns

prepare knowledge update recommendations

Product/Admin Must Do

maintain issue log with severity

tag issues as product, knowledge, scoring, ops, CRM, or training

ensure approved logic changes move through version control

42.8 Daily Cadence

Start of Day

Sales Head / Product Admin should review: - open high-priority leads - pending escalations - sync failures - prior day unresolved issues

During Day

Sales users should: - use the copilot live during active discovery - escalate only when rule conditions are met - avoid offline notes that never enter the system

End of Day

Sales Head / Product Admin should review: - leads processed during the day - new overrides - leads stuck without next action - recurring missing fields

42.9 Weekly Review Cadence

A structured weekly review is mandatory during the pilot.

Participants

Founder Reviewer

Sales Head

Sales Users in pilot

Ops Reviewer

Product/Admin Owner

CRM Admin if sync issues are material

Weekly Review Agenda

total pilot leads processed

score distribution

confidence distribution

discovery completeness trends

top missing fields

top duplicate or weak questions

top founder overrides

top ops feasibility corrections

notable wins/losses from pilot leads

logic changes to approve for next version

Weekly Output

approved logic updates

training actions for sales users

CRM fixes if needed

list of scenarios to add to test harness

42.10 Lead Handling SOP by Priority Band

High Intent Priority

Sales User: - contact fast within SLA - complete discovery thoroughly - check readiness early

Sales Head: - monitor closely - step in if confidence is low or lead is strategically important

Founder: - review if escalated

Qualified Priority

Sales User: - proceed with standard discovery and proposal path - avoid rushing if critical data missing

Sales Head: - review only if stuck or if lead is large/complex

Nurture / Clarify

Sales User: - focus on missing information - do not move to detailed proposal early

Sales Head: - monitor if lead lingers too long without clarity

Low Priority / Disqualify

Sales User: - re-scope if possible - otherwise mark appropriately

Sales Head: - review only for special strategic exceptions

42.11 Override Handling SOP

When an Override Happens

The responsible reviewer must capture: - what the system said - what was changed - why it was changed - whether the problem was knowledge, scoring, workflow, or UI understanding

Override Categories

service classification correction

scoring correction

feasibility correction

routing correction

proposal-readiness correction

field accuracy correction

Rule

An override is not only an exception. It is a training signal. Every recurring override pattern must be reviewed in weekly logic tuning.

42.12 Proposal Stage Handoff SOP

Before a lead moves to proposal stage, the salesperson must verify: - proposal-readiness status is appropriate - required fields are captured - assumptions are visible - risks are visible - feasibility flags are reviewed if needed

Handoff Package Should Include

requirement summary

confirmed fields

inferred fields

missing but non-blocking fields

score summary

recommended service path

assumptions

risk flags

relevant case studies

This package should be visible to proposal owner or salesperson preparing the proposal.

42.13 CRM Hygiene SOP During Pilot

CRM Admin / Product Admin Must Monitor

duplicate leads

field mismatch between system and CRM

missing mandatory fields after sync

invalid enum values

assignment mismatches

failed tasks or SLA tags

Rule

CRM should remain the operational record, but Entity Brain should remain the decision layer. Neither should silently overwrite the other without auditability.

42.14 Training SOP for Sales Users

Before pilot start, sales users should be trained on: - what the system is trying to do - what confirmed vs inferred means - how to use next-best question suggestions - when to escalate - how to correct fields - how to avoid bypassing the system - how proposal-readiness differs from general interest

Training Format Recommended

one walkthrough session

one scenario-based practice session

one shadow-mode review session

42.15 Pilot Issue Classification SOP

Every issue raised during pilot should be tagged as one of the following: - Knowledge issue - Scoring issue - Question quality issue - CRM sync issue - UI usability issue - Routing issue - Feasibility logic issue - Training issue - Performance/latency issue

This helps avoid vague statements like “the system is not good” and turns feedback into fixable categories.

42.16 Pilot Success Review SOP

At the end of each pilot cycle, leadership should review: - whether founder dependency reduced - whether discovery quality improved - whether high-priority leads were identified earlier - whether feasibility issues were caught earlier - whether sales adopted the system properly - whether logic is stable enough to expand

Expansion Decision Options

expand to more services

expand to customer-facing discovery bot

continue internal-only tuning

pause and fix specific modules before expansion

42.17 Pilot SOP Checklist

Daily Checklist

new pilot leads entered through system

high-priority leads reviewed

pending escalations addressed

sync failures checked

overrides logged

Weekly Checklist

pilot metrics reviewed

top weak questions reviewed

top overrides reviewed

top feasibility corrections reviewed

logic changes approved or deferred

End-of-Pilot Checklist

baseline vs pilot comparison completed

expansion readiness assessed

v2 improvement backlog created

42.18 Recommended Next Document

After this Pilot Operating SOP, the next most useful document is: Figma Wireframe / Prototype Prompt Pack

That will allow AIM to turn this specification into actual screen concepts quickly for design and build alignment.

43. Figma Wireframe / Prototype Prompt Pack

This section converts the AIM Entity Brain product specification into design-ready prompts.

These prompts are intended for: - Figma AI - a product designer - a UI/UX freelancer - low-code UI prototyping tools - internal frontend teams creating first-pass wireframes

Prompt Pack Objective

Generate usable screen concepts for the first version of AIM Entity Brain with: - clean B2B SaaS layout - premium but functional UI - strong information hierarchy - fast decision support for sales and leadership - minimal clutter during live usage

Design Direction

Use a clean, data-driven, premium interface style aligned to AIM’s broader design language: - white or very light backgrounds - dark navy text - AIM blue accents - rounded cards - subtle shadows - clean spacing - high readability - clear chips, tags, and status indicators - dashboard-first layout - modern enterprise SaaS feel

Global UX Principles

Sales must understand a lead in under 30 seconds.

The interface must clearly separate confirmed, inferred, and missing information.

Score, confidence, and proposal-readiness must always be visible.

The UI must support live call usage without forcing too much scrolling.

Important actions must be obvious: ask next question, assign, escalate, override, sync, move to proposal.

AI-generated recommendations must always be visually separable from human-confirmed facts.

43.1 Global Design Prompt

Master Prompt

Design a premium B2B SaaS product called AIM Entity Brain, an AI-powered sales intelligence and discovery copilot for a marketing and activation company. The product helps sales teams qualify leads, ask the right next question, score opportunities, recommend services, identify missing information, and route high-priority leads correctly. The UI should feel modern, clean, premium, and data-driven, with white backgrounds, dark navy typography, AIM-blue accents, rounded cards, light borders, subtle shadows, clean chip-based statuses, and strong information hierarchy. The design must support live sales usage, founder review, and CRM-style workflow. Use a desktop-first layout with modular cards, right-side action panels, sticky score/status areas, and clear separation

between confirmed data, inferred data, missing data, recommendations, and risk flags.

43.2 Screen Prompt: Lead Intelligence Dashboard

Prompt

Design a desktop web application screen for Lead Intelligence Dashboard inside AIM Entity Brain. This is the main screen used by sales teams to understand a lead quickly.

The page should include: - top header with lead name, company name, source channel, last updated time, assigned owner - prominent status chips for total lead score, confidence, proposal readiness, SLA priority, escalation flag - left column showing company and contact details, designation, industry, service category, sub-service, geography - central section showing requirement summary, target audience, timeline, budget band, campaign objective, preferred touchpoints - a clear Missing Information card showing unresolved critical fields - a Recommended Next Action card with suggested next step and why it matters - a Solution Recommendation card showing recommended service mix, campaign model, budget band, and top assumptions - a Case Studies / Supporting Proof card - right-side sticky sidebar with score breakdown, confidence explanation, proposal readiness, and quick action buttons - bottom activity timeline with recent interactions, sync events, overrides, and discovery milestones

Use a premium enterprise SaaS style, clean sections, rounded cards, subtle blue highlights, and fast scannability. Make the most important commercial information visible above the fold.

Key UI Elements to Include

score donut or score bar for total lead score

chip-style status labels

collapsible cards for long summaries

quick action buttons: Open Discovery Assistant, Assign Owner, Escalate, Sync CRM, Move to Proposal

visually distinct labels for Confirmed / Inferred / Missing

43.3 Screen Prompt: Live Discovery Assistant

Prompt

Design a desktop screen for Live Discovery Assistant in AIM Entity Brain. This is used by a salesperson during a live call or WhatsApp/email clarification flow.

The screen should feel fast, focused, and minimal-clutter.

The page should include: - left panel showing live transcript or conversation notes - center panel showing Next-Best Question card prominently at the top - below it, a list of alternative questions if needed - a structured answer capture area with editable fields - a Field State Tracker showing confirmed fields, inferred fields, missing critical fields, and recently updated fields - a live Score & Confidence Update panel showing how new answers affect qualification - a Proposal Readiness module that updates live - quick actions to mark answer confirmed, edit field, skip question with reason, request founder review, generate summary - a compact reasoning explanation under the next-best question, like “This question is needed to estimate campaign scope and pricing band.”

Use clean cards, sticky top question area, a strong center-column interaction area, and a right-side intelligence sidebar. The interface should help a salesperson move smoothly without losing conversation flow.

Key UI Elements to Include

“Next Best Question” highlighted in blue-accent card

inline tags showing Quote Critical / Feasibility Critical / Scoring Critical

animated or clearly visible score changes after answer capture

distinct boxes for Confirmed, Inferred, Missing

a top-right “Escalate for Review” button

43.4 Screen Prompt: Founder Review Panel

Prompt

Design a premium review interface for Founder Review Panel in AIM Entity Brain. This screen is used by a founder or sales head to review high-value or low-confidence leads.

The screen should include: - top header with lead identity, company, strategic account badge if applicable, escalation reason - top row of score cards for total score, confidence, strategic value, feasibility, proposal readiness - left section with system-generated lead summary, discovery summary, missing information, and conversation highlights - central section with System Recommendation card showing recommended service mix, next step, assumptions, risks, and suggested owner - right section with Override Controls to edit fields, change service classification, change owner, adjust readiness, or mark nurture/disqualify - a before/after comparison view when override is being entered - override reason input box - override history section showing previous changes, timestamps, and who made them - bottom timeline for recent decisions and review actions

Make the interface feel high-trust, executive, and low-noise. Use premium card layouts, score emphasis, and clear visual distinction between system recommendation and human override.

Key UI Elements to Include

escalation banner at top

split view: System Recommendation vs Override

mandatory override reason field

approve, edit, and override buttons

audit timeline

43.5 Screen Prompt: Solution Recommendation Panel

Prompt

Design a focused screen for Solution Recommendation Panel in AIM Entity Brain. This screen helps sales understand what to propose and why.

The page should include: - primary recommendation card with recommended service mix and campaign model - secondary alternatives card showing 1–2 alternative service paths - “Why this fits” section listing the business reasons for recommendation - “Budget & Timeline Guidance” card with suggested bands - “Assumptions” card and “Exclusions / Risks” card - supporting case studies panel with thumbnails or compact cards - quick actions: Accept Recommendation, Send to Proposal Prep, Compare Alternatives, Escalate

The design should feel strategic and commercially intelligent rather than overly technical. Use elegant cards, concise bullets, strong hierarchy, and premium spacing.

Key UI Elements to Include

recommendation confidence chip

info cards for assumptions and exclusions

linked case-study cards

primary CTA button for moving to proposal stage

43.6 Screen Prompt: Knowledge Admin Panel

Prompt

Design an admin console screen for Knowledge Admin Panel in AIM Entity Brain. This panel is used to manage services, industry playbooks, discovery questions, scoring config, case studies, and logic versions.

The page should include: - left navigation for Services, Industries, Questions, Scoring, Case Studies, Versions - main content area showing a table or card list of the selected knowledge object - edit drawer or side panel for updating records - status chips for Active, Draft, Archived, Needs Review - version management controls for publish and rollback - filters for service, industry, status, and owner - a top banner showing current live logic version

The design should feel like a modern internal admin SaaS panel: clean, organized, and efficient.

Key UI Elements to Include

searchable data tables

side-edit panel or modal

publish version button

rollback button

structured field forms

43.7 Screen Prompt: Weekly Pilot Analytics Dashboard

Prompt

Design a desktop analytics dashboard for AIM Entity Brain Pilot Review. This dashboard is used weekly by founder, sales head, and product/admin to assess pilot quality.

The page should include: - KPI cards for leads processed, average completeness score, duplicate question rate, override count, sync failure count, proposal-ready rate - charts for score distribution, confidence distribution, lead status distribution - a panel for top missing fields - a panel for top override categories - a panel for top weak questions or repeated question problems - a panel for conversion by score band - a table of high-risk pilot issues - a weekly action recommendation section

Use a premium analytics UI, clean charts, white background, dark text, restrained AIM-blue accents, rounded metric cards, and highly readable tables.

43.8 Low-Fidelity Wireframe Prompt Pack

Use these prompts when you want simple structural wireframes instead of polished UI.

Low-Fidelity Master Prompt

Create grayscale, low-fidelity wireframes for a B2B SaaS sales intelligence product called AIM Entity Brain. Focus on layout, information hierarchy, and workflow usability rather than visual polish. Use boxes, placeholders, labels, tables, cards, sidebars, tabs, and chips. Show desktop-first screen layouts for lead intelligence, live discovery, founder review, recommendation, and knowledge admin.

Low-Fidelity Screen Prompt: Lead Dashboard

Create a grayscale wireframe for a lead dashboard with a three-column layout: left for lead identity and company info, center for requirement summary and missing info, right for score, confidence, readiness, and action buttons. Include an activity timeline below.

Low-Fidelity Screen Prompt: Live Discovery Assistant

Create a grayscale wireframe for a live discovery screen with left transcript panel, center next-best question and answer capture area, and right field-state tracker with live score changes.

Low-Fidelity Screen Prompt: Founder Review

Create a grayscale wireframe for a founder review screen with escalation banner, summary area, system recommendation panel, override form, and audit timeline.

43.9 Clickable Prototype Flow Prompt

Prompt

Create a clickable prototype for AIM Entity Brain with the following flow: 1. user lands on Lead Intelligence Dashboard 2. clicks Open Discovery Assistant 3. sees next-best question and enters an answer 4. score and readiness update dynamically 5. user returns to dashboard and sees updated summary 6. user opens Solution Recommendation Panel 7. user chooses Escalate for Review 8. founder review screen opens with override controls 9. founder changes service path and submits override 10. dashboard updates with new recommendation and audit entry

The prototype should prioritize business workflow clarity over full UI polish.

43.10 Component Library Prompt

Prompt

Design a component library for AIM Entity Brain using a premium B2B SaaS design system. Include: - status chips - score cards - confidence indicators - summary cards - missing info alerts - field state badges for Confirmed / Inferred / Missing - side panels - activity timeline rows - editable table rows - recommendation cards - escalation banner - override modal - analytics KPI cards

Use consistent rounded corners, subtle shadows, navy typography, blue accents, clean grids, and high readability.

43.11 UX Copy Guidance for Prototype

Use short, professional labels and helpful assistant-style system text.

Suggested Label Examples

Lead Intelligence

Discovery in Progress

Recommended Next Step

Missing Critical Information

Proposal Readiness

High Intent Priority

Needs Human Review

Confirmed Information

Inferred Information

Escalation Reason

Recommended Service Mix

Why This Fits

Risks & Assumptions

Suggested Helper Text Examples

This question helps determine campaign scope and budget fit.

More information is needed before a scoped proposal can be prepared.

This lead is high-value, but confidence is low due to missing commercial details.

Feasibility should be validated before final commitment.

43.12 Recommended Prototype Build Order

Create design concepts in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel 6. Weekly Pilot Analytics Dashboard

This sequence matches the highest-value usage path for AIM.

43.13 Recommended Next Deliverables

After this prompt pack, the next strongest execution outputs are: 1. a Figma file or clickable prototype 2. an engineering estimation sheet by workstream 3. a knowledge ingestion tracker spreadsheet 4. a pilot-ready issue tracker template

At this point, AIM has enough specification depth to begin design, estimation, and phased build execution.

44. Knowledge Ingestion Operating Model

This section turns knowledge ingestion from a concept into a working operating model for AIM.

The goal is to make sure AIM can continuously convert: - founder knowledge - service know-how - case studies - proposals - SOWs - ops constraints - sales conversations - objections and rebuttals

into structured, versioned, usable Entity Brain knowledge.

Operating Model Principles

Ingestion is a recurring business process, not a one-time upload project.

Every important knowledge item should move through a defined workflow.

Nothing should become live without validation.

Every structured record must retain source provenance.

High-frequency commercial knowledge should be ingested first.

44.1 Knowledge Ingestion Workflow

Stage 1: Capture

Collect raw knowledge from founders, sales, ops, proposals, decks, and transcripts.

Stage 2: Inventory

List and tag the source with metadata.

Stage 3: Extract

Pull out commercially meaningful facts, patterns, conditions, and rules.

Stage 4: Normalize

Convert extracted points into structured entities.

Stage 5: Validate

Get service owner / founder / ops approval.

Stage 6: Publish

Push validated logic into active or draft knowledge version.

Stage 7: Monitor

Track where the ingested knowledge performs well or poorly in live usage.

Stage 8: Refresh

Update or retire stale knowledge.

44.2 Recommended Knowledge Repositories

AIM should maintain four distinct knowledge repositories.

Repository A: Structured Core Knowledge

Stores: - services - sub-services - discovery questions - scoring rules - routing rules - feasibility notes - objections - proposal modules

Repository B: Retrieval Knowledge

Stores: - case studies - decks - SOWs - proposal archives - transcripts - internal playbooks

Repository C: Working Draft Knowledge

Stores: - extracted but unvalidated records - founder interview notes - pending logic proposals - staging-only updates

Repository D: Historical / Archived Knowledge

Stores: - old logic versions - retired services - outdated pricing patterns - historical references

44.3 AIM-Specific Knowledge Domains to Ingest

Domain 1: Commercial Service Knowledge

what AIM sells

where each service fits

where it does not fit

what is required before quote

what is required before feasibility validation

Domain 2: Touchpoint Intelligence

IT parks

RWAs / apartments

malls

retail stores

colleges

gyms

LED vans

hybrid combinations

Domain 3: Industry Intelligence

FMCG

snacks / foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care

Domain 4: Sales Discovery Intelligence

must-ask questions

disqualifying signals

upsell signals

pilot vs rollout signals

budget discovery patterns

Domain 5: Delivery / Ops Intelligence

permissions

lead times

staffing assumptions

fabrication dependencies

city-level constraints

reporting realities

Domain 6: Case Study and Proof Intelligence

what proof to use for which lead

which results matter by category

what kind of case study helps which objection

Domain 7: Objection and Rebuttal Intelligence

budget objections

trust objections

timing objections

attribution objections

feasibility objections

“why this touchpoint” objections

44.4 Knowledge Item Types

Each ingested item should be classified into one of these types.

44.5 Detailed Source Inventory Template

Use this structure for every potential source.

44.6 Extraction Template by Source

When extracting from any source, capture the following.

44.7 Normalization Templates

A. Service Logic Normalization Template

service_name

sub_service_name

description

ideal_use_cases

non_ideal_use_cases

best_fit_industries

best_fit_audiences

44.8 Knowledge Validation Workflow

Validation Levels

Level 1: Content Validation

Checks whether the extracted content is understandable and correctly structured. Owner: Product/Admin

Level 2: Commercial Validation

Checks whether the logic matches real sales and founder thinking. Owner: Founder / Sales Head

Level 3: Feasibility Validation

Checks whether the guidance is operationally realistic. Owner: Ops Lead

Level 4: Publication Validation

Checks whether the item is ready for live logic versioning. Owner: Product/Admin + designated approver

Validation Status Options

Draft

Needs Commercial Review

Needs Feasibility Review

Approved for Staging

Approved for Live

Rejected

Archived

44.9 Knowledge Review SLAs

To prevent ingestion backlog from piling up, use practical turnaround targets.

44.10 AIM Knowledge Backlog Structure

AIM should maintain the ingestion backlog in four buckets.

Bucket A: Pilot-Critical Now

Needed before or during pilot.

Bucket B: High-Value Next

Strong value but not needed on day one.

Bucket C: Expansion Later

Useful for broader product scale after pilot stability.

Bucket D: Historical / Research

Useful for reference but not urgent to normalize.

44.11 Recommended AIM Pilot Knowledge Backlog

Bucket A: Pilot-Critical Now

Product Sampling — core definition

IT Park Sampling logic

RWA / Apartment Sampling logic

Mall Sampling logic

In-Store Sampling logic

Brand Activation — kiosk / demo logic

LED Van campaign logic

Top 5 beauty/skincare case studies

Top 5 FMCG/snack/beverage case studies

Top budget objections and responses

Top feasibility blockers by service

Founder scoring/routing signals for high-value leads

Bucket B: High-Value Next

Retail branding

Hybrid campaign solution logic

College sampling expansion

Gym / fitness outreach expansion

Menstrual hygiene campaign nuances

Pet care targeting logic

Additional case study tagging

Bucket C: Expansion Later

voice-call transcript intelligence

email thread mining

long-term win/loss patterns

advanced proposal-block recommendations

Bucket D: Historical / Research

old proposals with outdated pricing

one-off client exception SOWs

historical services no longer central to AIM

44.12 AIM First 25 Knowledge Tasks

Below is a practical starter backlog.

44.13 Founder Interview Pack for Ingestion

Use this structured format when capturing founder knowledge.

Founder Interview Questions by Service

When is this service the best fit?

When is this service a weak fit?

What are the first three questions you ask?

What information must you know before quoting?

What makes you cautious about this type of lead?

What signals tell you the lead is serious?

What common mistakes do salespeople make with this service?

What objections come up most often?

What is the best fallback or pilot option when scope is unclear?

Which case study do you usually reference and why?

Output from Each Interview

service rules

discovery questions

scoring signals

objection-response pairs

case study mapping

feasibility warnings

44.14 Sales Debrief Capture Format

Sales users should log structured insights after important calls.

Capture Fields

lead_id

service discussed

what questions worked well

where the prospect got confused

what objection came up

what information was hard to get

what the system got right

what the system got wrong

whether founder help was needed

recommendation for logic update

This is one of the best sources for real-world ingestion improvement.

44.15 Ops Debrief Capture Format

Ops should contribute not only when something fails, but as a proactive ingestion source.

Capture Fields

service / touchpoint

what feasibility assumption was unrealistic

what information sales missed

what timeline assumptions were wrong

what permission dependency was critical

what product handling concern existed

what future question should be asked earlier

44.16 Knowledge Freshness and Retirement Rules

A knowledge item should be marked “Needs Review” when:

pricing drivers change materially

permissions reality changes

a service definition changes

repeated overrides challenge the same rule

a case study becomes outdated or less relevant

A knowledge item should be archived when:

service is no longer actively sold

case study is no longer commercially useful

logic is replaced by a better version

pricing assumptions are obsolete and misleading

44.17 Knowledge Quality Scorecard

Each ingested knowledge item can be rated before publication.

Suggested Publication Rule

Only items with acceptable ratings across all core dimensions should move live.

44.18 Knowledge Ingestion Cadence Recommendation

Daily

capture new important insights from sales and ops

tag new useful source materials

Weekly

normalize priority items

review overrides and convert them into candidate logic updates

publish approved micro-updates if safe

Monthly

review service logic freshness

review question-bank effectiveness

archive stale knowledge

refresh case study relevance

44.19 Knowledge Ops Ownership Model

If AIM wants this system to stay strong, one person should effectively own knowledge operations.

Recommended Knowledge Ops Owner Responsibilities

maintain source inventory

coordinate extraction and normalization

chase reviews and approvals

ensure freshness and archive stale logic

prepare weekly knowledge update recommendations

track ingestion throughput and bottlenecks

This role can initially be handled by Product/Admin.

44.20 Recommended First Working Session Agenda

For AIM’s first hands-on knowledge ingestion workshop, run this agenda:

Session 1: Product Sampling Core (90–120 min)

define Product Sampling v1

define IT Park, RWA, Mall, In-Store variants

list quote-critical inputs by variant

list feasibility-critical inputs by variant

list top objections by variant

list strongest case studies by variant

approve draft discovery questions

Session 2: Activation + LED Van (60–90 min)

define kiosk activation logic

define product demo logic

define LED van logic

list misfit cases

approve scoring cues and escalation signals

Session 3: Industry Plays (60–90 min)

beauty/skincare

FMCG/snacks/beverages

wellness

baby care / menstrual hygiene where relevant

44.21 Recommended Next Output

The best practical next artifact after this operating model is: a Knowledge Ingestion Tracker with columns, statuses, owners, and the first AIM backlog pre-filled

That will convert this plan into an actual working tool for the team.

45. Service-by-Service Ingestion Pack

This section provides the actual ingestion packs AIM can use service by service.

Each pack is designed to help AIM move from raw founder knowledge and past documents into: - structured service records - discovery question banks - feasibility notes - objection-response pairs - case-study tags - proposal modules - scoring signals

How to Use This Section

For each service pack: 1. review the service definition internally 2. gather the recommended source materials 3. run founder / sales / ops capture session 4. normalize outputs into structured records 5. validate the pack before publishing it into the live knowledge version

Standard Pack Structure

Each service pack includes: - service purpose - what the Entity Brain must know - source materials to collect - founder capture prompts - sales capture prompts - ops capture prompts - structured entities to create - validation checklist - publication readiness checklist

45.1 Pack 1 — Product Sampling (Core)

Service Purpose

This is the parent commercial service. It defines AIM’s overall product sampling capability, where trial-based brand outreach is used to drive awareness, first use, consideration, and in some cases conversion or measurable response.

What the Entity Brain Must Know

what product sampling means in AIM’s context

what business objectives product sampling solves

which industries are best suited

which touchpoints are available under product sampling

where sampling is a weak fit

what must be known before quoting

what must be known before confirming feasibility

what proof/case studies to show by industry or touchpoint

Recommended Source Materials

AIM sampling service decks

founder explanations of sampling model

past sampling proposals and SOWs

sample budgets or cost breakups

case studies from beauty, FMCG, wellness, beverage, baby care, etc.

past client requirement notes

WhatsApp/email threads where sampling approach was explained

Founder Capture Prompts

In AIM terms, what exactly counts as product sampling and what does not?

When do you immediately know sampling is the right recommendation?

When do you avoid recommending sampling?

What are the top 5 questions you ask first?

What do you need before giving even a budgetary estimate?

Which touchpoints do you mentally shortlist first by category?

What makes a product sampling brief weak or risky?

What kind of client expectation usually creates trouble later?

Sales Capture Prompts

What type of brands ask for sampling most often?

What information do prospects most often fail to provide?

Which objections come up early most often?

What questions usually open up a better conversation?

Where do you most often need founder help today?

Ops Capture Prompts

What are the most common feasibility blockers in sampling?

Which handling or permission issues are often missed by sales?

What lead-time assumptions are most often unrealistic?

What reporting expectations should be carefully managed?

Structured Entities to Create

Product Sampling service record

parent discovery question set

universal quote-critical input set

universal feasibility-critical input set

universal sampling objections set

universal sampling scoring cues

touchpoint decision matrix

case-study map by industry and objective

Validation Checklist

service definition is clear and non-generic

best-fit industries are captured

clear misfit logic exists

all child touchpoints are referenced consistently

quote-critical inputs are complete but not excessive

feasibility notes reflect real delivery constraints

Publication Readiness Checklist

parent service record approved

universal sampling question bank approved

top 3 case studies tagged

pilot scoring cues approved

founder escalation signals approved

45.2 Pack 2 — IT Park Sampling

Service Purpose

Sampling executed in office parks, tech parks, or workplace clusters to reach working professionals and employee audiences.

What the Entity Brain Must Know

who this touchpoint is best for

when IT parks outperform malls or RWAs

premium vs volume-focused park choices

kiosk vs promoter-led distribution options

branding dependencies

employee audience fit by category

permission and access realities

Ideal Use Cases

beauty / skincare targeting working professionals

beverages and wellness products for office-going consumers

premium FMCG trial among salaried urban audience

product education in controlled weekday environments

Common Misfit Cases

products with no working-professional relevance

very low sample quantity requests where park access effort is too high

brands demanding very broad general household reach

extremely urgent campaigns with no time for park approvals/access coordination

Recommended Source Materials

past IT park proposals

lists of past venue types or corporate parks used

photos / proof of previous activations

staffing notes

permission notes and timelines

case studies with office-going TG

Founder Capture Prompts

When do you choose IT parks over malls or apartments?

What kind of products work best here?

How do you distinguish premium parks vs high-volume parks?

What does the client need to clarify before pricing is meaningful?

What usually gets underestimated in this touchpoint?

Sales Capture Prompts

What target-audience descriptions signal a strong IT park fit?

What questions help reveal whether the client wants interaction or only distribution?

What confusion do prospects typically have about office park access or quality of audience?

Ops Capture Prompts

How much lead time is typically needed?

What permissions or coordination models commonly apply?

What branding / setup limitations exist on site?

What manpower assumptions are realistic?

Structured Entities to Create

IT Park Sampling sub-service record

quote-critical question set

feasibility note set

premium-vs-volume venue assumptions guide

objections specific to workplace outreach

beauty/wellness/FMCG case-study tag group

Validation Checklist

working-professional TG logic is explicit

premium / scale differentiation is captured

permission model is described accurately

site setup options are clearly defined

Publication Readiness Checklist

one premium audience case study tagged

one volume-focused case study tagged

founder-approved must-ask questions loaded

feasibility notes validated by ops

45.3 Pack 3 — RWA / Apartment Sampling

Service Purpose

Sampling conducted in residential communities, apartment complexes, or gated societies to reach households and family decision-makers.

What the Entity Brain Must Know

which household-oriented categories fit best

how to distinguish premium apartments vs broad family communities

gate activity vs kiosk vs deeper engagement formats

society permissions reality

household decision-maker targeting logic

where residential outreach is a poor fit

Ideal Use Cases

baby care

household FMCG

family-use personal care products

food trial for family or community consumption

products where homemakers / parents / households matter

Common Misfit Cases

youth-only products with weak household relevance

categories better suited to workplace or college contexts

campaigns with no tolerance for society approvals or timing limits

premium niche categories that need a more controlled aspirational environment

Recommended Source Materials

apartment activation proposals

pricing sheets by society count or manpower model

permission notes

earlier residential campaign proofs

community-wise targeting notes if available

Founder Capture Prompts

What are the strongest buying situations for RWA sampling?

What signals tell you a client actually needs residential reach rather than mall or retail reach?

What are the first three things you ask about scale and society profile?

When do you reject or redirect the lead?

Sales Capture Prompts

What do prospects usually misunderstand about RWA execution?

What info is usually missing when they ask for pricing?

Which objections or hesitations come up most often?

Ops Capture Prompts

What permission models differ across apartments?

What timing rules or society restrictions are common?

What staffing assumptions or transport considerations matter?

Structured Entities to Create

RWA / Apartment Sampling sub-service record

society-type segmentation notes

quote-critical questions by residential model

permission dependency notes

household-relevance scoring cues

objections around permissions / community access / value perception

Validation Checklist

household TG logic is strong

premium vs broad-community distinction is captured

permission issues are realistic

scale planning logic is usable for quoting

Publication Readiness Checklist

at least 2 residential campaign examples tagged

key objections and responses approved

risk notes validated by ops

45.4 Pack 4 — Mall Sampling / Mall Activation

Service Purpose

Sampling or trial activity inside malls or public premium venues, often supported by kiosk, promoter interaction, or branded setup.

What the Entity Brain Must Know

when mall activation is worth recommending

premium-mall vs high-footfall-mall logic

kiosk vs promoter-only formats

branding/fabrication impact on cost and feasibility

demo-led vs handout-led differences

weekend vs weekday considerations

Ideal Use Cases

beauty / skincare

premium personal care

beverage, food, and new launches needing mass trial

products benefitting from visible public engagement

brands wanting premium perception plus reach

Common Misfit Cases

very low budgets for premium venues

products with no shopper interaction value

client not ready for branding/fabrication cost implications

B2B products with poor consumer venue relevance

Recommended Source Materials

mall activation proposals

fabrication cost sheets

mall permission notes

staffing models

photos and case studies

existing premium-vs-footfall venue notes

Founder Capture Prompts

When do you recommend mall before IT park or retail?

How do you distinguish premium need vs simple volume need?

What is the minimum information needed before pricing?

When do branding requirements materially change the solution?

Sales Capture Prompts

What do prospects usually ask first about malls?

What do they misunderstand about cost drivers?

Which questions help uncover whether a kiosk is really needed?

Ops Capture Prompts

What permissions, setup, or power needs matter most?

What fabrication turnarounds are realistic?

What site constraints affect demo-led activity?

Structured Entities to Create

Mall Sampling / Activation sub-service record

venue-tier logic notes

kiosk-vs-promoter scope rules

branding/fabrication cost driver notes

weekend/weekday planning assumptions

mall-specific objections and responses

Validation Checklist

venue tier logic is explicit

cost drivers are accurately captured

kiosk vs promoter-only differentiation is clear

demo/compliance concerns are noted where relevant

Publication Readiness Checklist

one premium mall case study tagged

one broad-footfall mall example tagged

fabrication notes validated by ops

45.5 Pack 5 — In-Store / Retail Sampling

Service Purpose

Sampling or product trial executed inside retail stores to influence shopper conversion, product education, and sell-out.

What the Entity Brain Must Know

when in-store is stronger than mall or residential

retailer / chain approval dependence

store count and chain specifics as cost drivers

demo / educate / distribute staffing differences

shelf / in-store conversion use case

store-level reporting expectations

Ideal Use Cases

launch support in modern trade or chain stores

sell-out push

shopper education for new or unfamiliar products

categories where point-of-purchase trial matters strongly

Common Misfit Cases

no retailer tie-up or unclear store access

no list of stores or chain context

client expects instant conversion attribution without retail control

extremely low store count with disproportionate approval effort

Recommended Source Materials

retail sampling proposals

store-level campaign reports

retailer-specific notes if available

approval dependencies

promoter training notes

case studies from retail chain activations

Founder Capture Prompts

When is in-store the right answer instead of mall or IT parks?

What do you need to know before even giving an initial estimate?

How do you judge whether the client has real retail access?

What kinds of products benefit most from in-store demo or education?

Sales Capture Prompts

What questions reveal whether retailer approval is real or assumed?

What common confusion exists between in-store branding and in-store sampling?

What are the most common client goals here: sell-out, awareness, education?

Ops Capture Prompts

What data is required from stores before execution?

What installation/demo rules matter on ground?

How do staffing/training assumptions change by category?

Structured Entities to Create

In-Store / Retail Sampling sub-service record

retailer approval logic notes

quote-critical question set by chain/store scenario

training-level / promoter-role notes

store-count pricing drivers

retail-specific objections and proof assets

Validation Checklist

store access dependency is explicit

conversion vs education objective split is clear

retailer-approval logic is realistic

staffing differences are captured

Publication Readiness Checklist

one retail-chain case study tagged

store/chain logic validated by sales and ops

must-ask questions approved

45.6 Pack 6 — Kiosk-Based Brand Activation / Product Demo Booth

Service Purpose

Interactive branded activation designed to attract attention, engage audiences, demonstrate the product, and support trial or education.

What the Entity Brain Must Know

when simple sampling should become a fuller activation

kiosk vs light branded setup vs promoter-only model

demo-led vs gamified vs engagement-led activation

branding/fabrication requirements

staff/training expectations

venue-space and power requirements

Ideal Use Cases

product launches needing interaction

categories requiring demonstration or education

premium public or retail environments

campaigns aiming for stronger recall than handout-only distribution

Common Misfit Cases

clients wanting only passive visibility with no interaction

no tolerance for fabrication or branding budget

very small-scale brief where a kiosk is overkill

categories with heavy demo/compliance restrictions not yet thought through

Recommended Source Materials

kiosk activation proposals

demo booth budgets

fabrication vendor templates

staff role descriptions

game / engagement format notes

execution photos and case studies

Founder Capture Prompts

What makes you move from sampling to activation?

What signs tell you the client needs engagement, not just distribution?

What are the most common activation formats AIM should standardize?

When does the kiosk become too heavy or unnecessary for the brief?

Sales Capture Prompts

What client words or goals signal this is really an activation brief?

What discovery questions help uncover branding or engagement expectations?

Which client misunderstandings about cost and complexity are most common?

Ops Capture Prompts

What setup requirements matter most on site?

What dependencies exist around fabrication, power, storage, transport, staff training?

What kind of lead times are realistic by venue type?

Structured Entities to Create

Kiosk Activation sub-service record

demo / gamification / education decision notes

branding/fabrication module rules

venue dependency notes

activation-specific objections and responses

proposal modules for kiosk scope variants

Validation Checklist

activation-vs-sampling distinction is clear

heavier-scope dependencies are captured

staffing and training assumptions are usable

venue dependency notes are grounded

Publication Readiness Checklist

at least 2 activation case studies tagged

fabrication module logic approved

ops risk notes reviewed

45.7 Pack 7 — LED Van / Mobile Outreach

Service Purpose

Vehicle-led mobile visibility or route-based campaign used for awareness, launch buzz, route coverage, or branch/hotspot-based exposure.

What the Entity Brain Must Know

when LED van solves the client’s objective and when it does not

route-based awareness logic

duration, city, and vehicle-type cost drivers

permissions and operating-hour realities

route planning needs

whether client wants visibility only or additional support like audio/promoter/branding

Ideal Use Cases

city-wide visibility bursts

launch buzz

route-specific awareness around branches, hotspots, events, or neighborhoods

quick reach-focused campaigns where awareness is the main job

Common Misfit Cases

clients expecting direct measurable conversion without support layers

no clarity on route, city, or duration

unrealistic immediate deployment when vehicle availability is constrained

clients needing deep interaction instead of visibility

Recommended Source Materials

LED van proposals

city-wise rate cards or budgets

route planning notes

vehicle availability notes

permission notes

photos / video proofs

Founder Capture Prompts

When do you recommend LED van over static media or on-ground activation?

What are the main commercial drivers for pricing and recommendation?

What is commonly misunderstood by clients about this format?

When should the lead be re-scoped because expectation is wrong?

Sales Capture Prompts

Which questions expose whether the client wants awareness or performance?

What do clients often fail to provide about routes, days, and city needs?

What objections usually come up around cost or utility?

Ops Capture Prompts

What availability and permission realities differ by city?

What are the standard operating assumptions around kilometers, hours, driver, fuel, tolls?

What lead-time caveats matter most?

Structured Entities to Create

LED Van / Mobile Outreach sub-service record

city / duration / route cost driver set

awareness-fit scoring cues

expectation-mismatch objection library

route planning note set

ops assumptions record by city where possible

Validation Checklist

route/visibility logic is clear

performance-vs-awareness expectation issue is captured

city-specific feasibility notes exist where possible

standard operating assumptions are explicit

Publication Readiness Checklist

at least 1 Bangalore and 1 Hyderabad example or note set if available

cost-driver structure approved

sales must-ask questions approved

45.8 Cross-Pack Standard Output Checklist

For every service pack before publication, AIM should have these minimum outputs: - 1 approved service record - 1 approved discovery question set - 1 approved quote-critical input list - 1 approved feasibility-critical input list - 1 approved risk / constraint note set - 1 approved objections-and-response set - 1 approved scoring cue set - at least 1 case study tagged, ideally 2+ - founder reviewer sign-off - ops sign-off if execution-sensitive

45.9 Cross-Pack Working Session Format

Session Format per Service

Duration: 45–75 minutes per service pack

Suggested Agenda

define the service in AIM terms

identify best-fit vs weak-fit use cases

finalize mandatory discovery questions

finalize quote-critical fields

finalize feasibility-critical fields

capture common objections

shortlist proof/case studies

note the top risk patterns

define escalation situations

approve draft structured records

45.10 Recommended Working Sequence for AIM

Use this order for the first ingestion cycle: 1. Product Sampling (Core) 2. IT Park Sampling 3. RWA / Apartment Sampling 4. Mall Sampling 5. In-Store / Retail Sampling 6. Kiosk Activation 7. LED Van / Mobile Outreach

This sequence matches the highest-value pilot logic already defined.

45.11 Recommended Next Artifact

After this service-by-service pack, the best next artifact is: a filled Knowledge Ingestion Tracker with these service packs broken into actionable rows, owners, and due dates

That will let AIM immediately begin execution service by service.

46. Filled Service-Record Pack — Product Sampling (Core)

This section provides the first fully filled service-record pack for AIM Entity Brain.

It is written in a format that can be directly used by: - Product/Admin during ingestion - founders during validation - engineering while shaping the knowledge schema - sales while understanding what the system should know

This is the parent service record for Product Sampling. Sub-services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

46.1 Service Record Header

46.2 Service Definition

Working Definition

Product Sampling is AIM’s controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

46.3 Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following: - product trial - awareness through physical experience - new product launch support - target-group-specific introduction - category education - sell-out assistance in supported environments - feedback collection after trial - trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

46.4 Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

46.5 Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

46.6 Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

46.7 Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

46.8 Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known: - product category - target audience - geography - timeline band - sample volume or scale band - preferred touchpoint or touchpoint recommendation path - campaign model (pilot / rollout) - budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

46.9 Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following: - permission dependency by chosen touchpoint - product handling requirements - temperature / tasting / demo constraints if any - timeline realism - promoter/staffing need - branding/setup scope if applicable - city-level ops availability - reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

46.10 Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by: - touchpoint type - city and geography spread - sample volume - campaign duration - promoter/manpower need - setup / kiosk / branding requirement - permissions dependency - reporting complexity - handling complexity of sample product - campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

46.11 Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

46.12 Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

46.13 Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say: - “Product Sampling is a strong parent fit.” - then recommend child path(s) with reason - then show assumptions and missing inputs before final scoping

46.14 Risk Flags

The system should explicitly warn when: - product category and venue appear mismatched - target audience is too broad for current scope - timeline may not support permissions or setup - scale is too low for chosen touchpoint economics - attribution expectations exceed planned campaign design - sample handling requirements are still unclear

46.15 Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by: - industry - objective - touchpoint - geography - audience type - scale band - reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

46.17 Validation Checklist — Filled

46.18 Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following: 1. founder review and wording approval 2. sales-head review of objections and discovery questions 3. ops validation of feasibility risks and handling constraints 4. case-study mapping for at least 3 strong parent references 5. confirmation of child-service inheritance model in knowledge schema 6. approval of parent scoring cues and escalation triggers

46.19 Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is: IT Park Sampling

Reason: - it is one of AIM’s highest-value sampling variants - it frequently needs nuanced founder judgment - it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM’s targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

19. Suggested JSON Shape

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Cross-Industry Recommendation Rules + Industry-to-Service Ranking Matrix

1. Document Purpose

This document defines the cross-industry recommendation layer for AIM Entity Brain.

Its purpose is to help the system answer one of the most important commercial questions consistently:

Given the industry, objective, audience, budget, timeline, and context, which AIM service should be recommended first, which should be recommended second, and which should be avoided?

This document is meant to sit above:

individual service records

individual industry playbooks

It acts as the decision bridge between them.

2. Why This Layer Matters

If the Entity Brain only knows:

what each service is, and

what each industry generally prefers,

that is still not enough.

It must also know:

when to prioritize precision over scale

when to prioritize trust over reach

when to prioritize conversion context over visibility

when to recommend pilot-first instead of rollout-first

when one service is the primary fit and another is only a secondary option

Without this layer, the system may produce flat recommendations instead of founder-like recommendations.

3. Recommendation Design Principles

Industry fit alone is not enough. Objective and audience context must refine the choice.

Service ranking should be conditional, not absolute.

Primary recommendation should solve the main business job.

Secondary recommendation should exist only if it meaningfully improves fit.

The system should clearly separate core fit from optional expansion paths.

Misfit logic should suppress attractive-but-wrong options.

If the environment can damage brand fit, that should override scale temptation.

4. Recommendation Output Model

For any qualified lead, the system should produce:

4.1 Primary Recommendation

The best current commercial path.

4.2 Secondary Recommendation

A viable alternative if:

budget is different

timeline is different

client preference shifts

feasibility weakens for the primary path

4.3 Optional Expansion Path

Only shown when:

hybrid campaign makes sense

phased rollout is sensible

a pilot-first followed by scale path is commercially strong

4.4 Suppressed Options

The system should internally mark low-fit options as:

weak fit

avoid unless client insists

misfit

5. Cross-Industry Service Ranking Scale

Use the following recommendation strength labels.

6. AIM Service Set Used in This Matrix

The matrix uses the following service options:

IT Park Sampling

RWA / Apartment Sampling

Mall Sampling / Mall Activation

In-Store / Retail Sampling

College / Campus Sampling

Gym / Fitness Sampling

Kiosk-Based Brand Activation / Product Demo Booth

LED Van / Mobile Outreach

Hybrid Campaign Solution

7. Industry-to-Service Ranking Matrix

7.1 Beauty / Skincare

Default Recommendation Bias

prioritize audience quality over raw trial volume

suppress low-context mass distribution for premium briefs

7.2 FMCG / Snacks / Beverages

Default Recommendation Bias

prioritize usage-context fit + scalable reach

handling/logistics can promote or demote a touchpoint sharply

7.3 Wellness / Nutrition

Default Recommendation Bias

prioritize credibility of environment and affinity of audience

only scale after context fit is established

7.4 Baby Care

Default Recommendation Bias

prioritize trust-first environments over pure reach

suppress loud, generic, or low-relevance public distribution

7.5 Menstrual Hygiene

Default Recommendation Bias

prioritize comfort, relevance, and education fit over broad reach

suppress any touchpoint likely to create awkward engagement dynamics

7.6 Pet Care

Default Recommendation Bias

prioritize actual pet-owner density over general reach

avoid broad non-owner distribution

8. Cross-Industry Meta Rules

8.1 Objective-to-Service Rules

If the primary objective is Product Trial

Bias toward:

Product Sampling environments first

then activation only if explanation/experience is necessary

If the primary objective is Education

Bias toward:

Kiosk-Based Activation / Demo Booth

In-Store / Retail Sampling

guided workplace / campus / controlled environments

If the primary objective is Sell-Out Support

Bias toward:

In-Store / Retail Sampling first

then supporting awareness or trial formats second

If the primary objective is Premium Visibility + Trial

Bias toward:

Mall Sampling / Mall Activation

Kiosk-Based Activation

then IT Park if premium audience precision matters more than public visibility

If the primary objective is Awareness / Launch Buzz

Bias toward:

Mall/public visibility

LED Van / Mobile Outreach

activation formats

sampling only if trial is part of the actual objective

8.2 Audience-to-Service Rules

Working Professionals

Prefer:

IT Park Sampling

IT Park + selective premium mall hybrid

workplace-led activation

Households / Parents / Family Consumers

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

selective family-footfall mall activation

Shoppers Near Purchase Context

Prefer:

In-Store / Retail Sampling

retail + demo activation

mall only if purchase-context access is weak but trial still valuable

Students / Youth

Prefer:

College / Campus Sampling

college + activation hybrid

mall only if youth public context is more commercially relevant than campus

Fitness / Wellness Users

Prefer:

Gym / Fitness Sampling

Gym + workplace hybrid

premium mall/public demo only if visibility matters alongside trial

Premium Public Audience

Prefer:

Mall Sampling / Mall Activation

Kiosk-Based Activation

selective IT Park if public visibility is less important than audience quality

8.3 Environment-Sensitivity Rules

High Environment Sensitivity Categories

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

premium Pet Care

Rule

For these categories, environment fit should carry extra recommendation weight.

The system should demote any touchpoint that is operationally possible but brand-wise weak.

8.4 Trust-Sensitivity Rules

High Trust-Sensitivity Categories

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule

When trust sensitivity is high:

prefer controlled, relevant environments

prefer trained promoter / guided interaction where appropriate

suppress low-context scale-first paths unless the brand explicitly prefers them

8.5 Scale-First vs Precision-First Rules

Default Precision-First Industries

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

Default Scale-First Industries

FMCG / Snacks / Beverages

Rule

If a scale-first industry has specialized handling or a niche audience, temporarily treat it like a precision-first brief.

If a precision-first industry has broader mass orientation and low environment sensitivity, allow controlled scale expansion.

9. Recommendation Tie-Breaker Rules

When two services look viable, use this tie-breaker order:

Audience relevance

Environment credibility / brand fit

Objective fit

Feasibility realism

Budget alignment

Case-study support availability

Speed to deploy

Example

If both Mall Sampling and IT Park Sampling are viable for a premium skincare brand targeting women professionals:

choose IT Park first if audience precision matters more

choose Mall first if public brand visibility is equally important

10. Pilot-First Recommendation Rules

The system should recommend pilot-first when:

the client is exploring a new touchpoint

the category is premium or trust-sensitive

audience quality matters more than raw volume

the brief is strategically important but still unclear

the product has handling or explanation complexity

the client wants measurable proof before scale

Pilot-First Output Language

“A pilot-first approach may be appropriate before broader rollout.”

“We recommend validating audience response in one city / one touchpoint first.”

“This touchpoint looks promising, but a controlled phase 1 will likely improve learning and reduce waste.”

11. Hybrid Campaign Recommendation Rules

The system should recommend Hybrid Campaign Solution only when one of the following is true:

the brief genuinely spans multiple distinct audiences

the objective requires both trial and visibility

the brand wants phased testing across environments

one touchpoint solves awareness while another solves conversion/trial

Good Hybrid Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid campaigns just to sound strategic. Recommend them only when they improve commercial fit materially.

12. Suppression Rules

The system should suppress or demote services when:

audience fit is weak

the environment can damage brand perception

permissions or access make the path unrealistic for the timeline

the budget makes the recommendation commercially misleading

the service solves a secondary objective but not the primary one

the recommendation depends on assumptions not yet acceptable for proposal stage

13. Ranking Matrix by Objective Pattern

13.1 Trial at Scale

13.2 Premium Targeted Trial

13.3 Education + Trial

13.4 Sell-Out Support

13.5 Awareness / Launch Buzz

14. Recommended Engine Logic Flow

When generating recommendations, the engine should apply this sequence:

classify industry

classify probable objective

classify target audience

classify environment sensitivity

classify trust sensitivity

classify scale-first vs precision-first need

retrieve ranked service candidates for that industry

rerank candidates based on objective and audience

suppress services failing misfit rules

promote pilot-first or hybrid path if conditions are met

generate primary, secondary, and optional expansion recommendation

15. Suggested Recommendation Output JSON

{
"industry": "Beauty / Skincare",
"objective": "Product Trial",
"target_audience": "Women Professionals",
"primary_recommendation": {
"service": "IT Park Sampling",

"reason": "Weak fit as a primary trial path for this audience and objective."
}
]
}

16. Validation Checklist

17. Publication Readiness Checklist — Pending Actions

Before this matrix goes live, AIM should complete the following:

founder review of all primary ranking assumptions

sales-head validation using 15–20 real past leads

ops validation where service feasibility can materially rerank choices

connect each ranked service to actual service-record logic IDs

test tie-breaker behavior across ambiguous multi-service leads

define admin-editable ranking override rules where necessary

18. Recommended Immediate Next Artifact

After this cross-industry recommendation matrix, the strongest next artifact is:

Industry-to-Service Decision Tree + Scenario Test Library

Reason:

the matrix defines the rules

the next step is to test those rules on real lead scenarios

this will help AIM catch wrong defaults before the engine goes live

AIM Beauty / Skincare — Industry Playbook

1. Document Purpose

This document contains the standalone Industry Playbook for Beauty / Skincare within the AIM Entity Brain knowledge-ingestion framework.

It is designed to help AIM capture how Beauty / Skincare brands think, buy, evaluate sampling/activation channels, and what commercial logic the Entity Brain should use when qualifying or recommending solutions.

This playbook should support:

discovery quality

service recommendation quality

pitch-angle selection

objection handling

scoring accuracy

case-study matching

founder-like commercial reasoning for beauty and skincare briefs

2. Industry Definition

Working Definition

Beauty / Skincare in the AIM context includes brands and product lines focused on:

facial skincare

body care

premium skincare

derma / active skincare

personal grooming products with skincare adjacency

cosmetic-skincare crossover products

self-care products where trial, routine fit, trust, and product education matter

Industry Characteristics

This category is usually:

highly target-group sensitive

perception-sensitive

environment-sensitive

trust-sensitive

trial-friendly when the right audience and context are chosen

often premium or semi-premium in positioning

Important Commercial Truth

For Beauty / Skincare, where the trial happens matters almost as much as how the trial happens.

The wrong environment can reduce brand fit even if the execution is operationally correct.

3. What the Entity Brain Must Know

The Entity Brain should understand the following about Beauty / Skincare briefs:

premium perception matters

environment quality affects response quality

target-group precision is usually more important than raw distribution scale

guided education can matter more than simple handout for some products

female-focused or premium-working-professional segments are often key

product trial can be powerful, but only when the setting aligns with product identity and target audience

brands may care about feedback, repeat usage intent, and trial quality more than just quantity

some subcategories need sensitivity around claims, skin type relevance, and demonstration tone

4. Buyer and Stakeholder Logic

Common Buyer Personas

Brand Manager

Marketing Manager

Category Manager

Founder / Co-Founder (especially D2C)

CMO / Marketing Head

Trade Marketing Manager

Growth / Performance-marketing influenced brand teams in D2C setups

Stakeholder Concerns

Beauty / Skincare decision-makers often care about:

relevance of target audience

premium fit of touchpoint

product education quality

perception risk

brand-image consistency

measurable post-trial signals

whether the activation feels “on-brand”

whether the environment attracts the right women / professionals / shoppers

Typical Internal Decision Dynamics

brand team may want premium fit and perception

trade team may want conversion or store movement

founder may want efficient pilot validation before scale

performance/growth stakeholders may ask about attribution or measurable response

5. Typical Business Objectives

Strongest Objectives in This Industry

product trial

premium target-group introduction

launch awareness

category education

guided trial for unfamiliar formulation/product

feedback capture after first use

targeted sampling to women professionals / premium shoppers / high-affinity segments

Secondary Objectives

lead capture for remarketing

QR / coupon-linked follow-up

retail conversion support

premium brand visibility

Weak / Misaligned Objectives

broad mass distribution with no target-group logic

low-quality reach for premium skincare brief

ultra-transactional performance expectation from touchpoint with no measurement design

aggressive sell-out expectation from a brand-awareness-only activity

6. Target Audience Logic

For Beauty / Skincare, the Entity Brain should push for greater audience clarity than in many FMCG categories.

Key Audience Dimensions to Capture

women / men / unisex relevance

age band

life stage

premium vs mass orientation

working professionals vs homemakers vs students

skin concern or category relevance if applicable

urban premium vs broad-market audience

purchase behavior: exploratory, routine, premium, problem-solution driven

High-Value Audience Patterns

women professionals in urban offices

premium mall shoppers

premium apartment communities

skincare-aware D2C shopper segments

wellness-oriented premium consumers

pharmacy / modern trade beauty buyers where education matters

Lower-Quality Audience Situations

broad unfiltered general crowd for premium skincare launch

environments that do not support brand identity or product explanation

settings where the trial audience is unlikely to be the buyer

7. Service Fit Logic for Beauty / Skincare

Strongest Service Fits

IT Park Sampling

Best when:

target is women professionals or urban working consumers

brand positioning is premium or aspirational

weekday high-quality audience matters

guided product introduction can be done efficiently

Mall Sampling / Mall Activation

Best when:

premium public visibility matters

the product benefits from visible trial and brand presence

the category needs aspirational retail/public context

kiosk or guided setup improves the experience

In-Store / Retail Sampling

Best when:

product education at point of purchase matters

retail conversion support is important

the brand is present in relevant modern trade or beauty retail environments

shopper hesitation can be reduced by in-store demo or explanation

Kiosk-Based Brand Activation / Demo Booth

Best when:

category education matters

the brand wants visual presence plus guided experience

the product requires more explanation than a simple sample handout

RWA / Apartment Sampling

Best when:

the product is highly relevant to women / families in premium communities

the objective is household-level trust and targeted community introduction

community context is a better fit than public venue

Moderate Service Fits

gym / studio outreach for skincare-wellness crossover or premium self-care angle

hybrid campaigns combining IT park + mall or mall + retail for layered objective

Weak / Misfit Service Fits

low-context mass distribution for premium skincare

youth-heavy campus-first campaigns unless the product truly fits that audience and brand tone

visibility-only mobile outreach unless part of a broader launch layer

8. Premium-Fit vs Mass-Fit Logic

Beauty / Skincare often requires the brain to reason about quality of audience and environment, not just volume.

Premium-Fit Signals

premium or semi-premium price point

founder/brand team emphasizes brand perception

product has routine or care-value rather than impulse-only nature

explanation, guided trial, or aspirational association matters

target audience is urban professional or premium shopper segment

Mass-Fit Signals

accessible price point with broad consumer relevance

trial at scale matters more than premium setting

product is simple enough for broader distribution environments

awareness is more important than elevated perception

Rule

If the brand is premium or skincare-education-led, the system should usually prefer audience-quality-first recommendations over mass-volume-first recommendations.

9. Discovery Question Bank — Beauty / Skincare Specific

These questions should be layered on top of service-specific discovery.

10. Quote-Critical Inputs for Beauty / Skincare

Before giving strong commercial direction in this industry, the system should try to know:

product category / SKU type

premium vs mass orientation

target user segment

environment preference or sensitivity

objective (trial / launch / education / retail support)

city or cities

scale or sample volume

engagement depth needed

budget band or budget openness

Minimum for Strong Recommendation

target user clear

product positioning clear

objective clear

city clear

probable touchpoint fit clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

engagement depth roughly known

environment quality preference roughly known

11. Feasibility / Delivery Considerations

Beauty / Skincare campaigns can fail commercially even when they are operationally completed. The brain should therefore treat brand-fit feasibility as well as execution feasibility seriously.

Important Feasibility Considerations

promoter grooming and product understanding

product explanation requirements

trial format suitability in venue

hygiene / handling requirements where applicable

whether demo/application context is simple or sensitive

premium-environment expectations vs actual execution scope

reporting expectations after trial

Brand-Fit Risks

cheap-feeling execution for premium product

wrong audience environment for brand tone

promoter interaction quality too weak for category depth

trial happening in a context that reduces perceived trust or desirability

12. Typical Objections and Response Directions

Response Principles

speak the language of audience quality, not just activity quantity

protect brand-image fit in every recommendation

do not sell scale-first if the brand is asking for premium relevance

use pilot framing when the brand is uncertain about touchpoint performance

13. Scoring Cues — Beauty / Skincare

Positive Signals

clear target user segment

premium-fit or audience-fit environment matters to the brand

product benefits from trial or education

brand is open to pilot-first validation

objective and segment are well articulated

the recommended touchpoint matches both audience and brand tone

Negative Signals

brand is premium but asks for low-quality mass distribution environment

no clarity on user segment

category education need is high but engagement budget is absent

expectation of strong conversion with no measurement design

touchpoint choice conflicts with brand positioning

Strategic Signals

high-credibility brand or D2C growth brand

strong case-study value in beauty/skincare vertical

potential for repeat use across launches / SKUs / regions

14. Recommendation Logic

When the lead is Beauty / Skincare, the system should prioritize recommendations using this order:

target user fit

brand-image / environment fit

objective fit

trial depth or education need

budget and feasibility

Typical Recommendation Patterns

Pattern A: Premium women professionals

IT Park Sampling

premium mall activation

pilot-first recommendation

Pattern B: Premium shopper/public visibility

Mall Sampling / Kiosk Activation

guided trial / demo support

Pattern C: Retail conversion support

In-Store / Retail Sampling

demo-led or education-led promoter support

Pattern D: Premium family / residential relevance

selective premium apartment / community sampling

Recommendation Output Style

The system should say things like:

“Because this is a premium skincare product targeting women professionals, a high-quality audience environment is likely more valuable than broad distribution volume.”

“A pilot across IT parks or premium mall environments may help validate trial quality before scale.”

“If product education is important, a kiosk/demo-led setup may perform better than handout-only distribution.”

15. Risk Flags

The system should explicitly warn when:

premium brand fit is being diluted by the recommended environment

audience precision is weak

product education need is high but execution is too light

the brief mixes performance expectations with awareness-only design

environment quality and brand expectations are misaligned

promoter/training requirements are underestimated

16. Case Study Tagging Guidance

Beauty / Skincare case studies should be tagged by:

premium vs mass orientation

women professionals / shoppers / families / youth audience

city

touchpoint

execution depth (handout / guided trial / demo / kiosk)

objective (trial / education / launch / retail support)

reporting depth

brand-positioning tone

Priority Case Study Buckets Needed First

premium skincare IT park sampling

beauty mall activation / kiosk example

skincare in-store retail education example

premium community sampling example

launch-stage trial + feedback example

17. Suggested JSON Shape

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Beauty / Skincare playbook goes live, AIM should complete the following:

founder review and wording approval

sales-head review of discovery prompts and objection handling

mapping of at least 3–5 relevant beauty/skincare case studies

validation of premium-vs-mass recommendation logic against real proposal history

refinement of buyer-persona notes based on AIM’s actual client mix

confirmation of service-ranking logic across IT parks, malls, retail, and premium communities

20. Recommended Immediate Next Playbook

After this Beauty / Skincare industry playbook, the next best playbook to fill is:

FMCG / Snacks / Beverages

Reason:

it is high-volume and commercially important for AIM

it contrasts sharply with Beauty / Skincare in scale logic and environment sensitivity

it will help the Entity Brain learn when to prioritize mass-trial logic versus premium-fit logic

AIM Industry-to-Service Decision Tree + Scenario Test Library

1. Document Purpose

This document converts AIM's cross-industry recommendation logic into:

practical decision trees

scenario-based recommendation tests

expected outputs for evaluation

failure patterns to watch before go-live

It is designed to help AIM validate whether the Entity Brain can make founder-like decisions under realistic lead conditions.

This document should be used by:

founders

sales head

product/admin

engineering

QA/evaluation team

2. Why This Document Matters

The ranking matrix tells the system what is generally stronger.

But in real life, leads are messy.

A good engine must handle:

incomplete information

competing objectives

mixed audiences

budget/timeline tension

touchpoint bias from clients

category sensitivity

So this document exists to answer:

When a real lead appears, what path should the system follow, and what output should it generate?

3. Decision Tree Design Principles

Start with the business job, not the touchpoint the client casually mentions.

Check audience fit before cost optimization.

For sensitive or premium categories, environment quality can outrank raw scale.

If feasibility is weak, recommendation strength must drop even when fit looks good.

If multiple services are viable, choose the one that best solves the primary objective.

Use pilot-first when ambiguity is commercially meaningful.

Suppress attractive but misleading options.

4. Master Decision Flow

The engine should evaluate in this order:

identify industry

identify primary objective

identify target audience

identify trust / environment sensitivity

identify scale-first vs precision-first need

identify purchase-context need vs awareness-only need

identify handling / compliance / execution complexity

identify budget and timeline realism

identify whether one service clearly dominates or hybrid is justified

generate primary, secondary, optional expansion, and suppressed options

5. Core Decision Trees

5.1 Decision Tree A — Product Sampling vs Activation vs Mobile Visibility

Step 1

If the client’s primary job is trial, go to Sampling path.

Step 2

If the client’s primary job is education + trial + visible interaction, go to Activation path.

Step 3

If the client’s primary job is awareness / launch buzz / route visibility, go to Mobile Visibility path.

Rule

Do not recommend LED Van / Mobile Outreach as the primary solution when the client actually needs product trial or guided education.

5.2 Decision Tree B — Choosing the Right Sampling Environment

If target audience = working professionals

Prefer:

IT Park Sampling

premium mall only if public visibility matters too

workplace + premium hybrid if justified

If target audience = households / parents / families

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

mall/family-footfall only when public visibility is also useful

If target audience = shoppers close to purchase

Prefer:

In-Store / Retail Sampling

retail + activation hybrid

mall only if purchase-context route is weak but trial still valuable

If target audience = students / youth

Prefer:

College / Campus Sampling

youth-heavy activation

mall only if public youth relevance is stronger than campus access

If target audience = fitness / performance users

Prefer:

Gym / Fitness Sampling

gym + workplace hybrid

premium public setup only if visibility matters too

5.3 Decision Tree C — Trust-Sensitive Category Rule

Applies to

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule Path

If category is trust-sensitive:

evaluate whether environment feels credible and relevant

demote touchpoints that are operationally possible but contextually weak

prefer guided interaction when education matters

prefer pilot-first if audience/context performance is uncertain

Example

If Baby Care brief asks for broad public mall handout at scale:

do not reject immediately

but demote mall as primary unless family-footfall relevance is very strong and tone can remain controlled

promote residential or family retail alternatives first

5.4 Decision Tree D — Scale-First vs Precision-First

If category is FMCG / Snacks / Beverages

Ask:

is usage relevance broad?

is trial scale important?

are handling requirements manageable?

If yes:

recommend scale-capable environments first

If category is Beauty / Skincare, Wellness, Baby Care, Menstrual Hygiene, Pet Care

Ask:

does audience quality matter more than quantity?

does trust or education matter?

can the environment affect perception?

If yes:

recommend precision / quality-first environments first

5.5 Decision Tree E — Retail Conversion Need

If primary objective includes any of the following:

sell-out support

shopper education near purchase

store movement

pharmacy / retail conversion

Then:

promote In-Store / Retail Sampling to primary or near-primary rank

use mall / public trial only as a support layer if helpful

use awareness-led formats only as secondary support

Rule

Do not let “visibility” overpower “purchase-context need” when the client’s stated goal is sell-out or conversion support.

5.6 Decision Tree F — Pilot-First Trigger

Recommend pilot-first when any of these are true:

category is premium or trust-sensitive

the client is testing a new touchpoint

the environment fit is plausible but unproven

the product has handling or training complexity

the client wants proof before scale

multiple services look viable but not conclusively so

Output Pattern

primary recommendation

clear “pilot-first” label

phase 2 expansion path if pilot succeeds

5.7 Decision Tree G — Hybrid Recommendation Trigger

Recommend hybrid only when:

the brief includes two distinct audience clusters

the brief needs both trial and visibility

a single touchpoint solves only part of the job

the brand wants phase-wise validation across environments

Good Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid by default when one service clearly solves the main objective well enough.

6. Scenario Test Library Structure

Each scenario includes:

lead brief

industry

objective

audience

known facts

unknowns

expected primary recommendation

expected secondary recommendation

expected suppression logic

whether pilot-first should trigger

why this case matters

7. Scenario Test Library

7.1 Scenario 1 — Premium Skincare Launch for Women Professionals

Lead Brief

A premium skincare brand wants to launch a serum in Bangalore and is targeting women professionals aged 24–35. They are considering sampling, want quality audience more than mass distribution, and have moderate budget.

Classified Inputs

Industry: Beauty / Skincare

Objective: Product Trial + Premium Introduction

Audience: Women Professionals

Geography: Bangalore

Budget: moderate

Timeline: within 30 days

Expected Output

Primary: IT Park Sampling

Secondary: Mall Sampling / Mall Activation

Optional Expansion: IT Park + premium mall hybrid

Suppress: LED Van as primary

Pilot-First: Yes

Why

Audience precision is stronger than public visibility as the primary job.

7.2 Scenario 2 — Snack Brand Wants High-Volume Trial in Bangalore

Lead Brief

A snack brand wants 25,000 sample trials in Bangalore over 2 weeks. They are open to colleges, IT parks, and malls. Product is simple to distribute and there are no heavy handling constraints.

Classified Inputs

Industry: FMCG / Snacks / Beverages

Objective: Mass Trial

Audience: broad youth + office-goers

Geography: Bangalore

Budget: reasonable

Handling: simple

Expected Output

Primary: Hybrid Campaign Solution

Secondary: IT Park Sampling or College Sampling depending city mix

Optional Expansion: Mall sampling for public visibility layer

Suppress: premium-only narrow channels as sole recommendation

Pilot-First: No, unless budget/timeline uncertainty exists

Why

This is a scale-first, usage-friendly product with multiple viable high-volume environments.

7.3 Scenario 3 — Protein Beverage for Fitness Audience

Lead Brief

A wellness brand wants to push a protein hydration drink among active gym-goers in Bangalore and Hyderabad. The team wants the right users, not random scale.

Classified Inputs

Industry: Wellness / Nutrition

Objective: Trial + Affinity Audience Introduction

Audience: Fitness Users

Geography: Bangalore, Hyderabad

Priority: affinity-first

Expected Output

Primary: Gym / Fitness Sampling

Secondary: IT Park Sampling if office-going wellness crossover exists

Optional Expansion: gym + workplace hybrid

Suppress: random mall/public trial as primary

Pilot-First: Yes

Why

Credibility of context matters. Fitness relevance outranks generic high-footfall reach.

7.4 Scenario 4 — Baby Care Product for Young Parents

Lead Brief

A premium baby-care brand wants to introduce a new lotion to parents of infants and toddlers in Bangalore. They care about trust and relevance more than mass reach.

Classified Inputs

Industry: Baby Care

Objective: Trust-Building Trial

Audience: Parents of infants and toddlers

Geography: Bangalore

Priority: trust-first

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling

Optional Expansion: premium communities + retail hybrid

Suppress: college, gym, LED van as primary

Pilot-First: Yes

Why

Trust-relevant family environment should dominate the recommendation.

7.5 Scenario 5 — Menstrual Hygiene Campaign for College Students

Lead Brief

A menstrual hygiene brand wants to build awareness and trial among college-age women in Chennai and Bangalore. Education is as important as product introduction.

Classified Inputs

Industry: Menstrual Hygiene

Objective: Education + Trial

Audience: College students

Geography: Chennai, Bangalore

Tone sensitivity: high

Expected Output

Primary: College / Campus Sampling

Secondary: Kiosk-Based Education / Activation Booth

Optional Expansion: college + workplace phase 2 if brand expands audience

Suppress: LED Van as primary, generic mass public handout

Pilot-First: Yes

Why

Education and comfort fit matter more than raw broad reach.

7.6 Scenario 6 — Pet Food Trial for Premium Pet Parents

Lead Brief

A pet-food brand wants to reach dog owners in premium apartment communities in Bangalore. They do not want broad household waste.

Classified Inputs

Industry: Pet Care

Objective: Targeted Trial

Audience: Dog owners in premium communities

Geography: Bangalore

Priority: owner relevance

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling in pet retail environments

Optional Expansion: premium community + pet retail hybrid

Suppress: mall/public mass distribution as primary

Pilot-First: Yes

Why

Pet-owner density and audience precision are critical.

7.7 Scenario 7 — Beverage Launch Wants Buzz, Not Sampling

Lead Brief

A beverage brand wants city-wide launch buzz for 5 days in Bangalore and Hyderabad. They want strong visibility fast and are not focused on trial in phase 1.

Classified Inputs

Industry: FMCG / Beverages

Objective: Awareness / Launch Buzz

Audience: broad public

Geography: Bangalore, Hyderabad

Speed: high

Expected Output

Primary: LED Van / Mobile Outreach

Secondary: Mall Activation if public visibility and physical brand presence are also needed

Optional Expansion: mobile outreach + selective sampling in phase 2

Suppress: product sampling as sole phase-1 recommendation if trial is not the current job

Pilot-First: Not necessary unless city/route ambiguity is high

Why

The core job is visibility, not trial.

7.8 Scenario 8 — Skincare Brand Wants Retail Sell-Out Support

Lead Brief

A skincare brand is already in a retail chain and wants stronger trial and shopper education to improve sell-out in 20 stores.

Classified Inputs

Industry: Beauty / Skincare

Objective: Sell-Out Support

Audience: Retail shoppers near purchase

Geography: Bangalore

Retail context: strong

Expected Output

Primary: In-Store / Retail Sampling

Secondary: Kiosk-Based Demo support where useful

Optional Expansion: retail + selective mall awareness if needed later

Suppress: IT Park as primary unless secondary objective emerges

Pilot-First: Yes if store behavior is untested

Why

Purchase-context need outranks premium audience experimentation.

7.9 Scenario 9 — Ambiguous Marquee FMCG Brief

Lead Brief

A well-known FMCG brand says, “We want something impactful pan-India,” but shares no real audience, no budget, and no clear objective.

Classified Inputs

Industry: FMCG

Objective: unclear

Audience: unclear

Budget: unknown

Strategic value: high

Expected Output

Primary: No strong service recommendation yet

Secondary: none until discovery improves

Optional Expansion: not applicable yet

Suppress: premature multi-touchpoint grand solution

Pilot-First: not yet; first recommend structured discovery

Escalation: Yes, high-value but low-confidence

Why

The system must resist looking smart by inventing a solution too early.

7.10 Scenario 10 — Budget-Misaligned Premium Mall Request

Lead Brief

A new brand asks for a premium multi-city mall activation but indicates a very low budget and wants immediate execution.

Classified Inputs

Industry: unknown consumer brand

Objective: visibility + trial perhaps

Budget: weak

Timeline: aggressive

Requested touchpoint: premium mall

Expected Output

Primary: Re-scope / clarify, not direct mall confirmation

Secondary: lighter public trial or pilot recommendation if relevant

Suppress: premium mall rollout as-is

Pilot-First: Yes if the client shows flexibility

Escalation: only if strategic value is high

Why

The system must protect against unrealistic client-led touchpoint bias.

8. Negative Test Cases

These are scenarios where the system should fail safely rather than force a recommendation.

8.1 Negative Case — Too Little Information

Expected behavior:

ask next-best question

do not recommend a service confidently

do not mark proposal-ready

8.2 Negative Case — High Budget but Wrong Audience Context

Expected behavior:

demote attractive but brand-weak environments

explain why a more relevant environment is stronger

8.3 Negative Case — Client Insists on Misfit Touchpoint

Expected behavior:

acknowledge the requested touchpoint

explain limitations

suggest better alternative

do not blindly confirm requested service as primary

8.4 Negative Case — High Strategic Brand, Low Confidence

Expected behavior:

escalate

avoid overcommitting

produce structured missing-information summary

9. Scenario Evaluation Rubric

Use this rubric to judge whether the engine behaves correctly.

Suggested Pass Standard

A scenario should pass only if the system gets the primary path, suppression logic, and reasoning explanation broadly right.

10. Expected Failure Patterns to Watch

During testing, watch for these recurring failures:

recommending the client’s mentioned touchpoint too early

overvaluing scale in trust-sensitive categories

overvaluing premium environments for broad FMCG needs

recommending hybrid campaigns too often

recommending LED/mobile formats when the true job is trial or education

weak suppression of misfit services

false proposal-readiness despite major unknowns

11. Suggested Testing Cadence

Round 1: Founder Calibration

run 10 scenarios manually with founder review

compare system recommendation vs founder recommendation

Round 2: Sales Calibration

run 10–15 real historical leads

compare recommendation usefulness for sales users

Round 3: Ops Calibration

test feasibility-sensitive scenarios

check whether the system under-warns or over-warns

Round 4: Pilot Live Monitoring

log real-world scenarios where recommendation changed after human review

turn those into new test cases

12. Suggested Scenario JSON Format

{

"scenario_id": "SCN-001",

"industry": "Beauty / Skincare",

"objective": "Product Trial",
"target_audience": "Women Professionals",
"geography": ["Bangalore"],
"known_facts": [
"premium product",
"moderate budget",
"working women"
],
"expected_primary_recommendation": "IT Park Sampling",
"expected_secondary_recommendation": "Mall Sampling / Mall Activation",
"expected_suppressed_services": [
"LED Van / Mobile Outreach"
],
"pilot_first_expected": true
}

13. Validation Checklist

14. Publication Readiness Checklist — Pending Actions

Before this decision-tree and scenario library goes live, AIM should complete the following:

founder review of all major scenario expectations

sales-head review of recommendation usefulness across real examples

ops review for feasibility-sensitive cases

addition of 15–20 real AIM historical lead scenarios

mapping of each scenario to service-record and industry-playbook IDs

creation of pass/fail evaluation sheet for QA and pilot reviews

15. Recommended Immediate Next Artifact

After this decision-tree and scenario test library, the next strongest artifact is:

Founder Calibration Workbook + Historical Lead Test Set

Reason:

the rules are now defined

the next step is to validate them against AIM’s actual founder judgment and past leads

this is the fastest way to catch wrong defaults before build hardening

AIM Product Sampling (Core) — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for Product Sampling (Core) from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas so that:

the main document remains lighter and safer to manage

the Product Sampling pack can be reviewed, validated, and iterated independently

AIM can use this as the working parent service record for ingestion

This is the parent service record for Product Sampling. Child services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

2. Service Record Header

3. Service Definition

Working Definition

Product Sampling is AIM's controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

4. Parent Business Objectives Solved

Product Sampling should be recommended when the prospect's goal includes one or more of the following:

product trial

awareness through physical experience

new product launch support

target-group-specific introduction

category education

sell-out assistance in supported environments

feedback collection after trial

trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

5. Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

6. Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

7. Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

8. Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

9. Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known:

product category

target audience

geography

timeline band

sample volume or scale band

preferred touchpoint or touchpoint recommendation path

campaign model (pilot / rollout)

budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

10. Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following:

permission dependency by chosen touchpoint

product handling requirements

temperature / tasting / demo constraints if any

timeline realism

promoter/staffing need

branding/setup scope if applicable

city-level ops availability

reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

11. Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by:

touchpoint type

city and geography spread

sample volume

campaign duration

promoter/manpower need

setup / kiosk / branding requirement

permissions dependency

reporting complexity

handling complexity of sample product

campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

12. Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

13. Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

14. Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say:

“Product Sampling is a strong parent fit.”

then recommend child path(s) with reason

then show assumptions and missing inputs before final scoping

15. Risk Flags

The system should explicitly warn when:

product category and venue appear mismatched

target audience is too broad for current scope

timeline may not support permissions or setup

scale is too low for chosen touchpoint economics

attribution expectations exceed planned campaign design

sample handling requirements are still unclear

16. Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by:

industry

objective

touchpoint

geography

audience type

scale band

reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

17. Service Record JSON Shape (Suggested)

{

"service_name": "Product Sampling",

"service_code": "AIM-SVC-PS-001",

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of objections and discovery questions

ops validation of feasibility risks and handling constraints

case-study mapping for at least 3 strong parent references

confirmation of child-service inheritance model in knowledge schema

approval of parent scoring cues and escalation triggers

20. Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is:

IT Park Sampling

Reason:

it is one of AIM’s highest-value sampling variants

it frequently needs nuanced founder judgment

it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM’s targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

19. Suggested JSON Shape

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Entity Brain — Product Requirements Document (PRD)

1. Document Summary

Product Name: AIM Entity Brain

Prepared For: AIM Leadership, Sales, Ops, Product, Engineering

Primary Goal: Convert founder-level commercial knowledge into a structured, scalable intelligence system that can qualify leads, guide discovery, recommend solutions, score opportunities, and sync clean intelligence into CRM.

2. Problem Statement

AIM’s best commercial judgment currently lives in the founders’ heads.

This creates recurring gaps: - Sales team depends too heavily on founders for requirement understanding and solution mapping. - Leads often come in with incomplete information, making proposal creation difficult or slow. - Discovery quality varies by salesperson. - Follow-up questions are sometimes repetitive, irrelevant, or not commercially useful. - CRM records are incomplete and inconsistent. - High-intent leads are not always identified early enough. - AI automation for chat or calling cannot work well without a strong company intelligence layer.

The business needs a system that can think more like a founder during lead intake and discovery.

3. Product Vision

AIM Entity Brain will be the company’s commercial reasoning layer.

It will: - understand services, sub-services, industries, deliverables, timelines, pricing logic, constraints, and case studies - ask the right next question based on context - avoid repetitive or low-value questioning - map lead requirements to solution pathways - score leads using AIM-specific commercial logic - assign the right salesperson or escalate for founder review - generate structured summaries and CRM-ready data - continuously improve from win/loss and human override feedback

This is not just a chatbot. It is a decision engine with memory, workflow, and learning.

4. Product Objectives

Primary Objectives

Improve discovery quality across all inbound leads.

Reduce founder dependency during lead qualification and solutioning.

Increase speed from inquiry to proposal readiness.

Improve CRM data quality and structured lead intelligence.

Create a reusable intelligence layer for sales copilot, chatbot, and AI telecalling.

Secondary Objectives

Improve lead routing and prioritization.

Reduce wasted effort on low-fit leads.

Standardize early-stage requirement gathering.

Improve consistency of proposal inputs.

Build long-term institutional memory.

5. Users

Primary Users

Sales Executives

Senior Sales Team

Sales Head

Founders

Business Development Team

Secondary Users

Operations team

Proposal team

CRM admins

Product and engineering team

External Users (Later Phase)

Website visitors

WhatsApp inquiry prospects

Outbound call recipients

6. User Problems to Solve

Sales Team Problems

“I do not know what to ask next.”

“I do not know if I have enough information to quote.”

“I do not know which service combination to pitch.”

“I need founder support for every nuanced inquiry.”

Founder Problems

“Sales keeps asking the same kind of questions.”

“Leads reach me with incomplete briefs.”

“Proposals are delayed because discovery was weak.”

“Commercial thinking is not standardized.”

Operations Problems

“Sales overpromises without checking feasibility.”

“Requirements are incomplete or vague during handoff.”

CRM Problems

“Lead records are incomplete.”

“Important commercial fields are unstructured.”

“Scoring and routing are inconsistent.”

7. Scope Definition

In Scope (Phase 1–3)

Service intelligence

Industry intelligence

Discovery question engine

Lead scoring engine

Solution recommendation engine

CRM field mapping

Internal sales copilot

External discovery chatbot

Case study retrieval

Proposal readiness assessment

Human override and feedback capture

Out of Scope (Initial Phase)

Fully autonomous proposal generation with final pricing approval

Fully autonomous discounting

End-to-end unattended telecalling at scale

Contract drafting automation

Final execution planning without human review

8. Core Product Principles

Ask only what changes the commercial decision.

Do not repeat what is already known.

Separate confirmed facts from inferred facts.

Do not promise beyond approved service logic.

When confidence is low, escalate to human review.

Every interaction should improve future intelligence.

9. Product Modules

9.1 Service Intelligence Engine

This module stores AIM’s service structure.

It should know: - service categories - sub-services - fit conditions - misfit conditions - ideal industries - ideal use cases - pricing bands - typical lead time - deliverables - exclusions - dependencies - risks - add-ons - reporting capabilities

Example Output

For a product sampling inquiry, the module should identify whether the use case is better suited for: - IT park sampling - mall activation - RWA sampling - in-store retail sampling - gym activation - quick commerce integration - multi-touchpoint pilot

9.2 Industry Intelligence Engine

This module stores how industries behave commercially.

It should know: - industry goals - buyer personas - decision cycles - budget behavior - common objections - relevant pitch angles - preferred channels/touchpoints - compliance or sensitivity issues - seasonality

Example

Skincare launches may require: - women-focused TG segmentation - premium environment fit - trial plus feedback mechanism - attribution discussion if D2C or marketplace-linked

9.3 Discovery Engine

This is the questioning brain.

It should: - identify critical missing information - select the next-best question - avoid duplicate questions - skip irrelevant questions - understand when enough information exists for the next stage - classify answers into structured CRM fields

Discovery Logic Rules

Each question should be tagged by: - service relevance - industry relevance - commercial purpose - mandatory for quote? - mandatory for feasibility? - mandatory for scoring? - ask-if conditions - skip-if conditions

Output Types

confirmed field update

inferred field update

missing information list

next-best question

9.4 Solution Mapper

This module translates discovery into recommended commercial solutions.

It should answer: - what service or sub-service fits best? - what touchpoint mix is appropriate? - should we propose pilot or full rollout? - what budget band is likely? - what timeline is realistic? - which case studies are relevant? - what risks should be flagged?

Example

If the lead is a beauty brand targeting working women in Bangalore with moderate budget and short timeline, the system may recommend: - IT parks + premium malls as primary mix - phase 1 pilot before scale - feedback capture + QR-based redemption - case studies from beauty/personal care category

9.5 FitScore Engine

This module calculates opportunity quality.

Score Components

Fit Score — 25

Authority Score — 15

Urgency Score — 15

Budget Score — 15

Completeness Score — 10

Strategic Value Score — 10

Feasibility Score — 10

Score Output Bands

80–100: High-priority qualified lead

60–79: Good lead, standard follow-up

40–59: Needs more information or nurture

Below 40: Low-fit or low-priority lead

Uses of Score

routing

SLA priority

founder escalation

proposal urgency

nurture vs immediate pursuit

9.6 Proposal Readiness Engine

This module checks whether enough information exists to move to proposal.

It should determine:

ready for capability deck only

ready for budgetary estimate

ready for scoped proposal

not ready; more discovery needed

It should also generate:

discovery summary

missing commercial inputs

suggested proposal modules

suggested case studies

suggested next action

9.7 CRM Intelligence Sync

This module converts conversation into structured CRM records.

It should update:

lead basic profile

service and sub-service

industry

objective

budget band

timeline

authority level

target audience

geography

completeness score

total lead score

recommended owner

recommended next step

missing information

It should also trigger:

task creation

SLA tagging

owner assignment

escalation to sales head/founder if required

9.8 Sales Copilot

This is the first interface to launch.

Primary Capabilities

show current lead understanding

show missing fields

suggest next questions during live call/chat

recommend service path

show lead score

show risks and assumptions

suggest case studies and pitch angle

indicate proposal readiness

Success Outcome

A salesperson should be able to handle a nuanced discovery conversation with much less founder intervention.

9.9 Discovery Chatbot

This is the second interface to launch.

Channels

website

WhatsApp

chat widget

Primary Capabilities

welcome and classify inquiry

ask context-aware questions

avoid repetitive questions

gather structured requirement data

create CRM lead

summarize requirements before handoff

hand over to human with clean context

Design Principle

The experience should feel like a smart pre-consultation, not a long lead form.

9.10 Voice Prospecting Engine (Later Phase)

This is the third interface to launch.

Uses

cold outreach

qualification calls

callback handling

early intent screening

It should use the same brain for:

pitch selection

objection handling

qualification logic

next-step routing

Strong Controls Needed

human escalation rules

no unsupported claims

no unapproved commercial commitments

call review and audit trail

10. Core Data Model

Key Objects

Service Master

Sub-Service Master

Industry Playbook

Discovery Question Bank

Solution Rules

Lead Profile

Lead Answers

Case Study Library

Objection Library

Proposal Modules

Feedback Events

Version Log

Field Status Types

Each commercially important field should have a status: - Confirmed - Inferred - Missing - Not Applicable

This is important so the system never confuses assumptions with actual customer-provided facts.

11. CRM Field Definitions

Lead Identity

company_name

contact_name

designation

phone

email

source_channel

inbound_or_outbound

Classification Fields

industry

company_size_band

service_category

sub_service_category

geography

Requirement Fields

campaign_objective

target_audience

target_geography

campaign_timeline

estimated_volume

budget_indicated

budget_inferred

reporting_expectation

attribution_expectation

approval_stage

Intelligence Fields

pitch_angle

risk_flags

assumptions

12. Key User Flows

12.1 Inbound Lead via Website / WhatsApp

User starts inquiry.

System classifies probable service and industry.

Relevant discovery logic loads.

Bot asks next-best question.

Structured fields are populated.

Lead score updates in real time.

Proposal readiness is evaluated.

CRM record is created/updated.

Salesperson is assigned.

Discovery summary is pushed to assigned owner.

12.2 Salesperson-Assisted Discovery

Salesperson opens lead.

Copilot shows known data and missing commercial fields.

Copilot suggests next-best questions.

Salesperson captures answers.

Engine updates score and recommendations.

Proposal readiness is checked.

Next action is recommended.

12.3 Founder Review Escalation

Lead has high strategic value or low confidence.

System flags for founder review.

Founder sees summarized context, missing information, and system recommendation.

Founder accepts, edits, or overrides.

Override is stored as learning input.

13. Screens / Interface Requirements

13.1 Lead Intelligence Dashboard

Must show: - lead overview - service classification - key requirement fields - score breakdown - confidence level - missing information - suggested next questions - recommended owner - proposal readiness

13.2 Discovery Panel

Must show: - live transcript or answer stream - questions already asked - fields already collected - next-best question suggestions - skipped questions and reason

13.3 Solution Recommendation Panel

Must show: - recommended service mix - why it is recommended - alternative options - likely budget band - timeline band - case studies - risks

13.4 Founder Review Panel

Must show: - summary - score - assumptions - missing information - escalation reason - approve / modify / override actions

13.5 Admin Knowledge Management Panel

Must allow: - add/edit services - add/edit question bank - update scoring logic - tag case studies - version control - activate/deactivate outdated logic

14. Functional Requirements

Must Have

structured service and industry knowledge storage

context-aware questioning

field-level state tracking

CRM field mapping

lead scoring

assignment logic

proposal readiness detection

human override capture

case study retrieval

audit logs

Should Have

objection handling suggestions

pitch-angle recommendation

email/WhatsApp summary generation

founder override analytics

win/loss learning dashboards

Later

AI voice calling

automated meeting scheduling

auto-generated tailored proposal drafts

predictive win probability

15. Non-Functional Requirements

fast enough for live salesperson use during calls

support multi-turn stateful conversations

secure access control by role

full auditability of question/answer flow

version control for service logic

scalable across multiple services and future brands

reliable CRM sync

fallback behavior if model confidence is low

16. Guardrails and Governance

Commercial Guardrails

no final price commitment without approved logic

no unsupported delivery promise

no unauthorized discounts

no invented case studies or results

Reasoning Guardrails

always distinguish confirmed vs inferred data

ask only relevant questions

never repeat confirmed questions

stop when enough information is available

escalate when confidence falls below threshold

Operational Guardrails

all high-value leads with low confidence require review

all overrides should be logged

all service definitions and question logic must be versioned

17. Analytics and Success Metrics

Sales Productivity Metrics

founder interruptions per lead

average discovery completeness score

average time to proposal readiness

average time from inquiry to first qualified summary

Lead Quality Metrics

qualified lead rate

high-score lead conversion rate

disqualification accuracy

proposal-to-win ratio

Bot Quality Metrics

duplicate question rate

irrelevant question rate

missing-field rate after discovery

confidence/escalation rate

structured field accuracy

Learning Metrics

number of founder overrides

override categories

recommendation accuracy over time

score accuracy vs actual sales outcomes

18. Phased Rollout Plan

Phase 1 — Knowledge and Logic Foundation

Deliverables

service taxonomy

sub-service taxonomy

industry playbooks

discovery question bank

lead scoring model

CRM field map

case study library tagging

founder override workflow

Goal

Create the structured commercial brain.

Phase 2 — Internal Sales Copilot

Deliverables

lead intelligence dashboard

live discovery assistant

CRM sync

score and routing engine

proposal readiness engine

Goal

Improve internal discovery and reduce founder dependence.

Phase 3 — External Discovery Bot

Deliverables

website/WhatsApp bot

stateful questioning

automatic lead structuring

human handoff summary

Goal

Qualify inbound leads consistently before sales handoff.

Phase 4 — Voice Prospecting Engine

Deliverables

AI outbound calling

transcript intelligence

callback routing

objection capture

review dashboard

Goal

Scale prospecting using the same entity brain.

19. Risks

Risk 1: Overloading with raw documents

Mitigation: normalize critical knowledge into structured entities.

Risk 2: Weak discovery logic

Mitigation: start with founder-reviewed question banks and override loops.

Risk 3: Overpromising by AI

Mitigation: strong commercial guardrails and required confidence thresholds.

Risk 4: Low user adoption by sales team

Mitigation: design for live call usability and measurable productivity benefits.

Risk 5: Incorrect scoring early on

Mitigation: tune scoring model with real lead outcomes and founder reviews.

20. MVP Definition

MVP Includes

core services and sub-services

top target industries

60–100 curated discovery questions

service recommendation logic

scoring engine

CRM writeback

internal sales copilot

founder review/override capture

MVP Excludes

public chatbot at launch

voice calling at launch

autonomous final pricing

autonomous proposal issuance

21. Launch Recommendation

Launch order should be: 1. Knowledge Core 2. Sales Copilot 3. CRM Intelligence Sync 4. External Discovery Bot 5. Voice Prospecting Engine

This sequence gives the fastest ROI and the safest learning loop.

22. Final Recommendation

AIM should build this first as an internal commercial intelligence and discovery copilot, not as a public chatbot.

Reason: - internal copilot creates immediate value - improves lead quality and CRM quality - generates training data - validates discovery logic safely - reduces founder dependency before customer-facing automation

Once internal discovery is strong, the same brain can power inbound chatbot and outbound AI calling with much higher accuracy and much lower risk.

23. Next Document to Create

After this PRD, the recommended next documents are: 1. Functional specification by module 2. CRM field mapping sheet 3. Knowledge model / ontology document 4. User stories and acceptance criteria 5. API and integration specification 6. Wireframes for dashboard and copilot screens 7. Rollout plan with owners and milestones

24. Module-wise Functional Specification

24.1 Module: Knowledge Core

Purpose

Store and manage AIM’s structured commercial intelligence.

Inputs

service definitions

sub-service definitions

industry playbooks

discovery questions

pricing bands

case studies

objections

proposal modules

execution constraints

version changes

Core Functions

create and maintain service records

create and maintain industry records

manage question bank with conditions

manage solution rules

manage case study tagging

manage version history

activate/deactivate outdated logic

Outputs

structured knowledge objects for orchestration engine

searchable case studies and commercial assets

version-controlled service logic

Business Rules

every active service must have at least one discovery path

every service must define mandatory inputs for quote and feasibility

every question must be mapped to a field or decision purpose

outdated logic must not be used in live workflows once deactivated

Dependencies

admin panel

database

retrieval store

access control

Admin Actions

add service

edit service

archive service

add industry playbook

edit questions

adjust scoring logic references

upload case study assets

24.2 Module: Discovery Engine

Purpose

Run context-aware questioning and field-state tracking.

Inputs

current lead state

known fields

missing fields

service context

industry context

prior questions asked

confidence signals

Core Functions

classify inquiry

identify critical unknowns

select next-best question

avoid duplicate questioning

mark fields as confirmed/inferred/missing/not applicable

determine if enough information exists to proceed

Outputs

next-best question

updated field state

missing information list

discovery summary

proposal readiness signal

Business Rules

do not ask a question if field is already confirmed unless clarification is required

ask only questions relevant to current service and stage

stop discovery when minimum information threshold is reached for next step

low-confidence inference must be marked as inferred, not confirmed

Dependencies

knowledge core

orchestration engine

CRM field map

conversation layer

24.3 Module: Solution Mapper

Purpose

Translate discovered requirements into commercially relevant solution paths.

Inputs

service classification

industry classification

discovered lead attributes

solution rules

case studies

pricing references

feasibility notes

Core Functions

recommend service and sub-service mix

recommend touchpoint mix

suggest pilot vs full rollout

estimate budget band

estimate timeline band

identify relevant case studies

highlight delivery risks and dependencies

Outputs

recommended solution path

alternative options

budget band suggestion

timeline guidance

case study shortlist

risk flags

Business Rules

no final pricing commitment without approved pricing logic

if feasibility is unclear, flag human review

solution recommendations must reference only active services

24.4 Module: FitScore Engine

Purpose

Score the lead according to AIM-specific commercial logic.

Inputs

authority data

fit data

budget data

urgency data

completeness state

feasibility state

strategic value indicators

Core Functions

calculate component scores

calculate total score

assign lead band

recommend SLA level

recommend escalation path

Outputs

score breakdown

total score

confidence score

routing recommendation

Business Rules

missing critical fields should reduce completeness and confidence

high strategic value can increase priority but should not hide feasibility issues

leads above configured threshold should trigger faster assignment

24.5 Module: CRM Intelligence Sync

Purpose

Map structured lead intelligence into CRM and trigger workflow.

Inputs

lead identity data

discovered commercial fields

scores

recommendations

ownership logic

Core Functions

create new lead

update existing lead

write structured fields

create tasks

assign owner

tag SLA priority

attach discovery summary

log recommendations and missing data

Outputs

CRM record

owner assignment

task queue entries

activity log

Business Rules

required lead fields must be validated before CRM sync

existing leads should be updated, not duplicated, where match confidence is sufficient

every CRM write must be auditable

24.6 Module: Sales Copilot

Purpose

Support salespeople in live discovery, qualification, and next-step planning.

Inputs

CRM lead state

discovery engine output

score output

solution recommendations

Core Functions

display lead understanding

display missing fields

suggest next questions live

show recommended pitch angle

show case studies and risks

show proposal readiness

Outputs

salesperson guidance

improved discovery quality

faster handoff to proposal stage

Business Rules

salesperson must be able to override system suggestions

overrides must be logged with reason if they change major fields or recommendations

24.7 Module: Discovery Chatbot

Purpose

Run external prospect qualification in a structured but conversational way.

Inputs

prospect messages

channel context

discovery logic

known company/contact data

Core Functions

greet and classify inquiry

ask next-best question

maintain state across turns

summarize requirement

sync to CRM

hand off to human when appropriate

Outputs

structured lead brief

handoff summary

live lead score

Business Rules

no repetitive questions

do not request unnecessary information

escalate when prospect asks for commitments outside approved scope

preserve context across channel turns where technically possible

24.8 Module: Founder Review & Override

Purpose

Allow high-value or low-confidence leads to be reviewed and corrected by founder/sales head.

Inputs

lead summary

score

confidence status

escalation reason

system recommendation

Core Functions

show escalation context

allow approval/edit/override

log override reason

write override back into system

feed override into learning loop

Outputs

final approved direction

learning signal

updated CRM and recommendation state

Business Rules

all overrides must be logged

override should distinguish between pricing correction, service correction, discovery correction, or routing correction

24.9 Module: Learning & Evaluation Layer

Purpose

Improve the brain over time through outcomes and review.

Inputs

lead outcomes

win/loss reasons

override logs

question quality ratings

recommendation accuracy reviews

Core Functions

track performance by module

identify failure patterns

identify weak questions

identify weak scoring rules

support review cycles

suggest updates to knowledge logic

Outputs

evaluation dashboards

quality reports

update recommendations

Business Rules

only approved logic updates should affect production behavior

historical outcomes should remain linked to the version used at the time

25. User Stories

25.1 Sales Executive

As a sales executive, I want to see the missing information for a lead so that I know what to ask next.

As a sales executive, I want the system to suggest relevant questions during a call so that I can conduct better discovery.

As a sales executive, I want to know whether the lead is ready for proposal so that I do not waste time preparing incomplete quotes.

As a sales executive, I want the system to suggest the right service mix so that I can pitch confidently.

As a sales executive, I want case study recommendations relevant to the lead so that I can strengthen my conversation.

25.2 Sales Head

As a sales head, I want high-intent leads to be prioritized automatically so that the team focuses on the right opportunities.

As a sales head, I want low-confidence but high-value leads to be escalated so that important opportunities are not mishandled.

As a sales head, I want to review scoring logic and override patterns so that I can improve sales quality.

25.3 Founder

As a founder, I want the system to capture my commercial reasoning in structured form so that the company can scale beyond founder dependency.

As a founder, I want to review escalated leads with complete context so that I can intervene quickly and effectively.

As a founder, I want overrides to improve the system so that repeated corrections reduce over time.

25.4 Operations Manager

As an operations manager, I want the sales handoff to include clear deliverables, assumptions, and risks so that execution planning is accurate.

As an operations manager, I want feasibility-sensitive leads to be flagged early so that sales does not overpromise.

25.5 CRM Admin

As a CRM admin, I want structured field mapping from conversations so that lead records remain clean and useful.

As a CRM admin, I want duplicate lead checks before sync so that the CRM stays reliable.

25.6 External Prospect

As a prospect, I want the chatbot to ask relevant questions without repetition so that the experience feels intelligent and professional.

As a prospect, I want the system to understand my requirement before transferring me to a salesperson so that I do not have to repeat myself.

26. Acceptance Criteria

26.1 Knowledge Core

Admin can create, edit, archive, and version services.

Admin can attach mandatory discovery fields to each active service.

Admin can map each question to a field or decision purpose.

Archived service logic is not used in new live recommendations.

26.2 Discovery Engine

System does not ask a field-confirming question again unless clarification is needed.

System selects questions based on service, industry, stage, and missing critical fields.

System marks each important field as confirmed, inferred, missing, or not applicable.

System can indicate when sufficient information exists for the next stage.

26.3 Solution Mapper

System provides at least one recommended solution path when minimum discovery threshold is met.

System includes risk flags when feasibility-related data is weak or missing.

System does not generate solution recommendations using inactive services.

26.4 FitScore Engine

System calculates and stores component-wise score breakdown.

System assigns lead band based on configured thresholds.

System recalculates score when critical new answers are added.

26.5 CRM Intelligence Sync

System can create a new lead with required structured fields.

System can update an existing lead without creating duplicates where match logic is satisfied.

Every CRM write action is logged with timestamp and source.

26.6 Sales Copilot

Sales user can see known fields, missing fields, score, and next-best questions in one view.

Sales user can submit an override to system suggestions.

Override reason is stored for review when major changes are made.

26.7 Discovery Chatbot

Bot can maintain context across at least one multi-turn discovery flow.

Bot avoids duplicate questions within the same conversation.

Bot can produce a structured lead summary before human handoff.

Bot can hand off to human when low confidence or out-of-scope request is detected.

26.8 Founder Review

Escalated lead shows score, confidence, summary, risks, and recommendation in one place.

Founder can approve, edit, or override system recommendation.

Override is recorded and sent to learning layer.

26.9 Learning Layer

System stores lead outcome and override events.

System can report question quality and recommendation accuracy trends.

Logic updates require approval before being activated in production.

27. Screen-wise Requirements

27.1 Screen: Lead Intelligence Dashboard

Must Display

lead profile header

company/contact details

source channel

service classification

score breakdown

confidence indicator

proposal readiness status

missing information list

recommended next action

Actions

open discovery panel

assign owner

escalate for review

sync/update CRM

open related case studies

27.2 Screen: Live Discovery Assistant

Must Display

current conversation transcript or notes

questions already asked

next-best question suggestions

field status tracker

answer capture inputs

Actions

mark answer as confirmed

edit inferred values

skip question with reason

request founder review

27.3 Screen: Solution Recommendation Panel

Must Display

recommended service mix

recommended touchpoints

estimated budget band

estimated timeline band

case study suggestions

assumptions

risks and exclusions

Actions

accept recommendation

choose alternative recommendation

send to proposal stage

escalate

27.4 Screen: Founder Review Panel

Must Display

escalation reason

system summary

system score

confidence status

recommendation

override history if any

Actions

approve

edit fields

override recommendation

change owner

send feedback to system

27.5 Screen: Knowledge Admin Panel

Must Display

list of services

list of industries

list of question banks

version history

active/inactive status

Actions

add/edit/archive entries

change question conditions

upload case studies

publish new version

28. Workflow State Definitions

SOPs

30. Release Plan by Sprint Theme

Sprint Theme 1

finalize data model

finalize service taxonomy

finalize question bank framework

Sprint Theme 2

build knowledge admin layer

build service and industry records

build field-state model

Sprint Theme 3

build discovery engine logic

build next-best question selector

build scoring engine

Sprint Theme 4

build lead intelligence dashboard

build sales copilot interface

build CRM sync

Sprint Theme 5

founder review workflow

override logging

evaluation dashboard basics

Sprint Theme 6

external discovery bot beta

handoff summary generation

pilot testing with selected inbound channels

31. Recommended Next Deliverables

The next documents to create after this functional specification are: 1. Detailed CRM field mapping sheet 2. Service taxonomy sheet 3. Discovery question matrix by service and industry 4. Scoring

model configuration sheet 5. Wireframes for dashboard, copilot, and founder review screens 6. API contract and event schema 7. Pilot rollout plan with ownership and milestones

32. Detailed CRM Field Mapping Sheet

This section defines the recommended CRM field structure for AIM Entity Brain.

The objective is to ensure that every discovery conversation produces: - clean structured CRM data - commercially useful lead records - reliable routing and prioritization - proposal-readiness visibility - auditability of inferred vs confirmed information

Field Design Principles

Every critical commercial field must have a clear source.

Important fields should distinguish between confirmed and inferred values.

Fields should support both human entry and AI-generated updates.

CRM fields must support downstream actions such as assignment, SLA, proposal preparation, and escalation.

Free-text notes should not replace structured fields for core qualification data.

32.1 Lead Identity Fields

32.2 Company Intelligence Fields

32.3 Contact Authority Fields

Recommended Decision Maker Status Values

Final Decision Maker

Strong Influencer

Evaluator / Researcher

Procurement Only

Agency Intermediary

Unknown

32.4 Requirement Classification Fields

Recommended Inquiry Type Values

New Requirement

Repeat Requirement

Capability Check

Budgetary Exploration

Proposal Follow-up

Partnership Inquiry

Vendor Registration

32.5 Timeline and Volume Fields

Recommended Timeline Urgency Values

Immediate (0–7 days)

Within 30 Days

Within Quarter

Exploratory / No Fixed Timeline

32.6 Budget and Commercial Fields

Recommended Budget Band Values

Below 1L

1L–3L

3L–10L

10L–25L

25L+

Unknown

32.7 Qualification and Discovery Fields

Recommended Proposal Readiness Values

Not Ready

Ready for Capability Deck

Ready for Budgetary Estimate

Ready for Scoped Proposal

Needs Human Review

32.8 Scoring Fields

Recommended Lead Priority Bands

High Intent Priority

Qualified Priority

Nurture / Clarify

Low Priority

Disqualify

32.9 Routing and Ownership Fields

Recommended Next Action Values

Schedule Discovery Call

Send Capability Deck

Send Budgetary Estimate

Prepare Proposal

Founder Review

Nurture

Disqualify

32.10 Solution Recommendation Fields

32.11 Channel Conversation Fields

32.12 Audit and Learning Fields

32.13 Required Minimum Field Set by Stage

Stage: New Lead

Required minimum: - lead_id - company_name or phone/email - source_channel - lead_origin_type - first_contact_timestamp

Stage: Discovery In Progress

Required minimum: - service_category - industry_primary - requirement_summary - discovery_stage - requirement_completeness_score - next_best_question

Stage: Qualified / Assigned

Required minimum: - total_lead_score - lead_priority_band - recommended_owner_team - SLA_priority - proposal_readiness_status - missing_information_summary

Stage: Proposal Ready

Required minimum: - service_category - sub_service_category (if known) - campaign_objective_primary - target_geography - timeline_urgency_band - budget_band - proposal_readiness_status - assumptions - risk_flags

32.14 Field Source Hierarchy

When multiple sources provide values, use this order unless manually overridden: 1. Human-confirmed user input 2. Founder / sales head override 3. Salesperson confirmed entry 4. Reliable system enrichment 5. AI inference

Rule

If AI inference conflicts with human-confirmed data, human-confirmed data wins.

32.15 Recommended CRM Object Structure

Lead Object

Stores primary lead identity and qualification state.

Account Object

Stores company-level long-term information.

Contact Object

Stores contact-level person details.

Opportunity Object

Created when lead reaches commercial seriousness threshold.

Activity Object

Stores calls, chats, emails, tasks, and follow-up actions.

Intelligence Snapshot Object

Stores AI-generated summary, scores, recommendation, assumptions, and confidence state for each major interaction cycle.

32.16 Recommended System Events

lead.created

lead.updated

discovery.started

discovery.answer.captured

discovery.completed

score.updated

owner.assigned

escalation.triggered

proposal.readiness.changed

founder.override.created

outcome.recorded

These events will help product and engineering maintain auditability and workflow automation.

32.17 Implementation Notes

Use structured enums wherever possible for routing-critical fields.

Keep requirement_summary, missing_information_summary, assumptions, and risk_flags as generated long-text fields, but do not depend only on them.

Preserve all major AI writes with timestamps and version metadata.

Keep score components stored separately, not just the total score.

Ensure duplicate detection uses phone, email, company, and source-side identifiers where available.

Make proposal_readiness_status and quote_readiness_status separate fields.

Every field updated by AI should carry a traceable source or origin in the data_origin_map.

32.18 Recommended Next Document

After this CRM mapping sheet, the next most important document is: Service Taxonomy + Discovery Question Matrix by Service and Industry

That will define exactly what AIM sells, where it fits, and what the system must ask before recommending or quoting.

33. Service Taxonomy Sheet

This section defines the recommended AIM service taxonomy for the first production version of the Entity Brain.

The purpose of this taxonomy is to ensure that the system can: - classify inquiries correctly - understand service fit and misfit - know what information is required before quoting - know what information is required before feasibility confirmation - map requirements into the correct commercial path

Taxonomy Design Principles

Start with a limited number of commercially meaningful service categories.

Separate service categories from touchpoints.

Distinguish quote inputs from feasibility inputs.

Define misfit cases clearly so the system knows when not to push a service.

Ensure each active service has at least one discovery path and one proposal path.

33.1 AIM Core Service Categories

Level 1 Categories

Product Sampling

On-Ground Brand Activation

Retail / In-Store Branding

Transit / Mobile Outreach

Residential Community Outreach

Corporate / Workplace Outreach

College / Youth Outreach

Fitness / Lifestyle Outreach

Mall / Public Venue Activation

Hybrid Campaign Solutions

Notes

Some categories are solution categories.

Some are execution environment categories.

For the Entity Brain, this is acceptable as long as the system clearly maps service logic and touchpoint logic separately.

33.2 Service Taxonomy Table

33.3 Detailed Service Definitions

33.3.1 Product Sampling

Description

AIM executes controlled product trial campaigns across selected touchpoints to drive awareness, trial, and in some cases conversion or attribution.

Primary Use Cases

product launches

new market entry

consumer trial

sell-out support

brand awareness with sampling

trial-to-conversion campaigns

Typical Industries

FMCG

beauty and skincare

personal care

wellness and nutrition

beverages and food

baby care

pet care

menstrual hygiene

Core Deliverables

touchpoint planning

promoter deployment

sample distribution

interaction or engagement execution

reporting and proof of execution

optional feedback capture

optional redemption or conversion-linked mechanism

Mandatory Quote Inputs

product category

city/cities

target audience

planned scale or sample volume

desired timeline

preferred touchpoints

Mandatory Feasibility Inputs

permission dependency

sample handling/storage constraints

staff requirement

venue access model

activation hours or timing restrictions

Common Risks

unclear target audience

unrealistic timeline

mismatch between brand and touchpoint

insufficient permissions lead time

no clarity on sample volume

33.3.2 On-Ground Brand Activation

Description

AIM creates interactive brand experiences to drive engagement, education, recall, and trial.

Primary Use Cases

new launches

experiential engagement

product demonstration

lead generation in physical environments

recall campaigns

Typical Industries

consumer brands

personal care

wellness

FMCG

electronics and appliance retail tie-ins

Mandatory Quote Inputs

venue type

activation objective

duration

branding scope

promoter/staffing expectation

Mandatory Feasibility Inputs

space availability

fabrication requirements

venue permissions

power or display requirements

safety or compliance restrictions

33.3.3 Retail / In-Store Branding

Description

AIM executes store-level visual branding and shopper visibility solutions.

Primary Use Cases

retail launch visibility

store branding rollout

shelf impact improvement

shopper conversion support

Mandatory Quote Inputs

store count

city/cities

element types required

quantity per store

execution timeline

Mandatory Feasibility Inputs

store measurement availability

retailer approvals

material specifications

installation windows

access conditions

33.3.4 Transit / Mobile Outreach

Description

AIM executes route-based, vehicle-based, or transit-facing brand visibility campaigns.

Primary Use Cases

awareness campaigns

launch buzz

route-based reach

hyperlocal visibility

Mandatory Quote Inputs

city

vehicle type

duration

quantity

date range

Mandatory Feasibility Inputs

inventory availability

local permissions

route constraints

branding production lead time

33.3.5 Hybrid Campaign Solutions

Description

AIM combines multiple touchpoints under one campaign objective for broader relevance and reach.

Primary Use Cases

multi-audience launch

pilot + scale rollout

integrated visibility + trial campaign

category education across multiple environments

Mandatory Quote Inputs

campaign objective

target segments

geography

budget band

timeline

Mandatory Feasibility Inputs

cross-touchpoint ops readiness

permissions dependency map

staffing availability

reporting framework needs

33.4 Industry Fit Notes

33.5 Service Misfit Logic

The Entity Brain should explicitly disqualify or deprioritize opportunities when any of the below are true: - the requested touchpoint does not match the target audience - the lead wants a firm quote without minimum commercial information - timeline is too short relative to permission and ops dependencies - product category is incompatible with venue or audience - stated budget is far below realistic threshold and client shows no flexibility - client expectation depends on outcomes not reasonably controllable by the service - there is no viable permission or access route

34. Discovery Question Matrix by Service and Industry

This matrix defines what the Entity Brain should ask before recommending, scoring, routing, or quoting.

Matrix Design Principles

Questions must have a purpose.

Questions must map to a field or decision.

The system should distinguish must-ask from nice-to-have.

The system should know which question affects quote, feasibility, score, or case-study selection.

The system should not ask the same question in multiple ways unless clarification is needed.

Question Type Tags

Must Ask = essential for qualification or solutioning

Quote Critical = required before meaningful budgetary estimate or proposal

Feasibility Critical = required before delivery confidence

Scoring Critical = affects lead quality or routing

Optional Depth = helpful, not mandatory in first pass

34.1 Universal Discovery Core Questions

These questions apply to almost all services.

34.2 Product Sampling — Core Discovery Matrix

34.3 IT Park Sampling — Service-Specific Questions

34.4 RWA / Apartment Sampling — Service-Specific Questions

34.5 Mall Sampling / Mall Activation — Service-Specific Questions

34.6 In-Store / Retail Sampling — Service-Specific Questions

34.7 College / Youth Sampling — Service-Specific Questions

34.8 Gym / Fitness Sampling — Service-Specific Questions

34.9 Brand Activation / Kiosk — Service-Specific Questions

34.10 Retail / In-Store Branding — Service-Specific Questions

34.11 LED Van / Mobile Outreach — Service-Specific Questions

34.12 Hybrid / Multi-Touchpoint Campaign — Service-Specific Questions

34.13 Industry-Specific Question Add-Ons

FMCG / Foods / Snacks

Beauty / Skincare / Personal Care

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

34.14 Question Priority Rules

The Entity Brain should use the following order when choosing the next question: 1. Questions required to understand objective and audience 2. Questions required to identify service fit 3. Questions required to assess timeline and feasibility 4. Questions required to understand scale and budget 5. Questions required to refine proposal quality 6. Optional depth questions only after the above are sufficiently answered

34.15 Stop Rules for Discovery

Discovery should pause and route to the next stage when: - objective is known - target audience is known - geography is known - probable service fit is known - timeline is known at least in band form - budget is known or reasonably inferred for next step - critical feasibility blockers are either known or flagged

If these are not available, the system should not mark the lead as proposal-ready.

34.16 Escalation Rules During Discovery

Escalate to founder or sales head when: - high-value brand but very low confidence - requirement spans multiple service categories with unclear commercial priority - prospect requests final pricing too early without critical data - service fit is ambiguous or appears weak - feasibility risk is high due to timeline, permissions, or category sensitivity - the prospect is a strategic account or marquee brand

34.17 Recommended Next Document

After this Service Taxonomy and Discovery Matrix, the next strongest document is: Scoring Configuration Sheet + Wireframes for Lead Intelligence Dashboard and Live Discovery Assistant

That will convert the logic into usable system behavior and UI structure.

35. Scoring Configuration Sheet

This section defines the detailed scoring logic for AIM Entity Brain.

The purpose of the scoring model is to help AIM: - prioritize the right leads quickly - reduce effort spent on low-fit opportunities - route leads to the right salesperson or escalation path - create a consistent commercial qualification standard across the team - separate exciting leads from actually viable leads

Scoring Design Principles

Score for commercial quality, not just surface interest.

Keep component scores visible; never rely only on one total score.

Distinguish lead attractiveness from execution feasibility.

Penalize missing critical data through completeness and confidence.

Allow founder override, but record it as a learning signal.

35.1 Scoring Model Overview

Total Score = 100

35.2 Fit Score Configuration (0–25)

Objective

Measure how well the lead’s need matches AIM’s services, execution models, and target categories.

Negative Adjustments

Guidance

20–25 = strong fit

14–19 = moderate fit

8–13 = weak fit

below 8 = poor fit or probable misfit

35.3 Authority Score Configuration (0–15)

Objective

Measure whether AIM is speaking to someone who can influence or close the buying decision.

Positive Modifiers

Cap Rule

Authority Score cannot exceed 15.

35.4 Urgency Score Configuration (0–15)

Objective

Measure how time-bound and sales-actionable the opportunity is.

Negative Adjustments

Guidance

Urgency should not overpower feasibility. A rushed but impossible lead is not high-quality.

35.5 Budget Score Configuration (0–15)

Objective

Measure commercial seriousness and likely budget alignment with the probable solution.

Positive Modifiers

Negative Adjustments

Cap Rule

Budget Score cannot exceed 15.

35.6 Completeness Score Configuration (0–10)

Objective

Measure whether enough commercial information exists for meaningful next action.

Critical Fields Considered

service category

campaign objective

target audience

target geography

timeline

scale or sample volume

decision maker status

budget band or budget orientation

Rules

inferred fields contribute less than confirmed fields when calculating completeness confidence

if service category is unknown, completeness cannot exceed 4

if objective is unknown, completeness cannot exceed 5

35.7 Strategic Value Score Configuration (0–10)

Objective

Measure longer-term business value beyond immediate project size.

Rules

Strategic value can increase priority, but cannot override severe feasibility issues.

35.8 Feasibility Score Configuration (0–10)

Objective

Measure whether AIM can realistically execute the requirement as discussed.

Negative Adjustments

Guidance

8–10 = strong feasibility

5–7 = feasible with caution

2–4 = weak feasibility

0–1 = likely not feasible without major clarification

35.9 Confidence Score Configuration (0–100)

Confidence is separate from lead quality.

Objective

Measure how reliable the system’s understanding and recommendations are.

Confidence Inputs

Confidence Bands

80–100 = High Confidence

60–79 = Medium Confidence

Below 60 = Low Confidence

Rules

high-value leads with low confidence should escalate

low confidence should suppress premature proposal-ready status

confidence should drop when fields are contradictory or mostly inferred

35.10 Lead Priority Band Logic

35.11 Routing Rules by Score and Confidence

35.12 SLA Recommendation Rules

35.13 Proposal Readiness Rules Based on Score + Completeness

A lead may be marked:

Ready for Capability Deck

If: - objective known - probable service fit known - target audience known - geography known

Ready for Budgetary Estimate

If: - above capability deck conditions met - timeline band known - scale band or rough volume known - budget orientation known or pilot openness exists

Ready for Scoped Proposal

If: - service/sub-service reasonably clear - geography clear - objective clear - timeline clear - scale clear - budget band known or commercial path agreed - feasibility risk not high - confidence at least medium

Needs Human Review

If: - high value but low confidence - ambiguous service fit - high-risk feasibility - client insists on final quote too early

35.14 Escalation Trigger Rules

Escalate when any of the following is true: - total score >= 80 and confidence < 60 - strategic value score >= 8 and service fit is ambiguous - feasibility score <= 3 but urgency score >= 10 - budget mismatch severe but brand value is high - opportunity spans multiple service lines with unclear primary path - prospect is a marquee account, key founder connection, or board-level contact

35.15 Example Scoring Scenarios

Example A: Strong Skincare Launch Lead

brand manager from known beauty brand

wants Bangalore IT park + mall trial campaign

launch within 30 days

decent budget band disclosed

target audience clear

scale reasonably known

Suggested score: - Fit: 22 - Authority: 11 - Urgency: 12 - Budget: 12 - Completeness: 8 - Strategic: 7 - Feasibility: 7 - Total: 79 - Confidence: 82

Routing: standard qualified priority with fast assignment.

Example B: Marquee Brand, Vague Brief

well-known FMCG brand

asks for “something impactful pan-India”

no budget, no specific audience, no timeline clarity

contact is mid-level marketing executive

Suggested score: - Fit: 15 - Authority: 8 - Urgency: 4 - Budget: 3 - Completeness: 3 - Strategic: 9 - Feasibility: 3 - Total: 45 - Confidence: 42

Routing: founder/sales head review because strategic value is high but clarity is poor.

Example C: Low-Budget Misfit Lead

unknown brand

asks for premium mall activation in multiple cities

budget extremely low and fixed

wants final quote immediately

Suggested score: - Fit: 8 - Authority: 6 - Urgency: 9 - Budget: 1 - Completeness: 5 - Strategic: 2 - Feasibility: 2 - Total: 33 - Confidence: 68

Routing: low priority or disqualify unless client agrees to re-scope.

35.16 Override Rules

Human override should be allowed for: - score correction - strategic value correction - authority correction - feasibility reassessment - routing reassignment

Override Logging Must Capture

who overrode

what changed

why it changed

date/time

logic version originally used

35.17 Recommended Configurability

The following should be admin-configurable: - point values by score band - routing thresholds - SLA thresholds - escalation triggers - strategic account rules - service-specific penalties - proposal readiness gates

35.18 Recommended Next UI Behavior Tied to Scoring

show component scores, not only total score

visually highlight missing critical fields that are reducing score/confidence

display why a score was assigned in plain language

allow human edit for corrected data before score recalculation

clearly show when a high-value lead is being escalated because of low confidence

36. Wireframe Requirements

This section defines the UI structure for the first product version.

The aim is not visual design polish yet. The aim is to make the product buildable by defining the screen structure, information hierarchy, and primary actions.

36.1 Screen: Lead Intelligence Dashboard

Goal

Give sales and leadership a single-pane commercial view of a lead.

Main Sections

Lead Header

Qualification Snapshot

Score and Confidence Panel

Requirement Summary

Missing Information

Recommended Next Step

Solution Recommendation

Case Study Suggestions

Activity Timeline

Layout Suggestion

Left column: lead identity, contact info, company info

Center column: requirement summary, missing data, next questions

Right column: scores, routing, confidence, proposal readiness, escalation flags

Fields to Show

company name

contact name and designation

source channel

service category

sub-service category

industry

target audience summary

geography

timeline band

budget band

total score

component scores

confidence band

proposal readiness

assigned owner

escalation/founder review flag

Key Actions

assign owner

open live discovery assistant

mark as escalate

view recommended case studies

open CRM record

move to proposal stage

log override

Acceptance Criteria

user can understand lead quality in under 30 seconds

user can identify missing critical data without opening another screen

score and confidence are visible at first glance

36.2 Screen: Live Discovery Assistant

Goal

Help salesperson or bot run structured discovery without repetition.

Main Sections

Conversation Stream / Notes

Field Status Tracker

Next-Best Question Suggestions

Captured Answers

Recommendation Preview

Quick Actions

Layout Suggestion

Left panel: transcript or conversation notes

Center panel: structured answer cards and next question suggestions

Right panel: field status, score changes, confidence changes, proposal readiness

Fields to Show

asked questions

skipped questions and reasons

confirmed fields

inferred fields

missing critical fields

next-best questions

current score snapshot

confidence snapshot

Key Actions

ask suggested question

mark answer confirmed

edit field manually

skip question with reason

request founder review

recalculate score

generate summary

Acceptance Criteria

system does not repeat confirmed questions

user can see why the next question is being suggested

score updates after major answer capture

36.3 Screen: Solution Recommendation Panel

Goal

Show the recommended commercial path clearly and explain why it fits.

Main Sections

Primary Recommendation

Alternative Recommendation(s)

Why This Fits

Budget and Timeline Guidance

Risks and Assumptions

Supporting Case Studies

Fields to Show

recommended service mix

recommended touchpoint mix

campaign model (pilot / rollout)

budget band

timeline band

assumptions

exclusions

risks

case study links

Key Actions

accept recommendation

compare alternatives

send to proposal prep

escalate for human review

Acceptance Criteria

user can distinguish recommendation from assumption

user can see at least one reason behind each recommendation

unsupported inactive services are never shown

36.4 Screen: Founder Review Panel

Goal

Allow founder or sales head to quickly correct, approve, or redirect important leads.

Main Sections

Escalation Summary

Lead Snapshot

System Recommendation

Risk / Confidence Indicators

Override Controls

Change Log

Fields to Show

escalation reason

total score and confidence

strategic value score

feasibility score

discovery summary

missing information

recommendation

prior overrides if any

Key Actions

approve recommendation

edit fields

change owner

force proposal stage

mark nurture/disqualify

submit override reason

Acceptance Criteria

founder can make a decision in under 2 minutes for normal escalations

all overrides are logged with reason

system recommendation remains visible alongside override

36.5 Screen: Knowledge Admin Panel

Goal

Allow admin or product team to maintain service logic and question logic.

Main Sections

Services

Industries

Question Banks

Scoring Config

Version History

Case Study Tags

Key Actions

create/edit/archive service

update question conditions

update scoring thresholds

activate new version

rollback version if needed

Acceptance Criteria

admin can update active logic without breaking historical records

version history is visible and searchable

only approved users can publish logic changes

36.6 Cross-Screen Design Requirements

Required Global UI Elements

lead score chip

confidence chip

proposal readiness chip

source channel badge

escalation badge

last updated timestamp

logic version indicator

Required Behaviors

every important AI-generated field should be traceable

human-edited fields should show override marker

screen should clearly separate confirmed vs inferred data

critical missing fields should be visually highlighted

36.7 Recommended Prototype Order

Build wireframes/prototypes in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel

This order matches the sequence of highest business value for AIM.

36.8 Recommended Next Document

After this scoring sheet and wireframe spec, the next most useful document is: API Contract + Event Schema + Pilot Rollout Plan

That will give engineering integration clarity and give leadership a phased implementation path.

37. API Contract Specification

This section defines the recommended API surface for AIM Entity Brain.

The API layer should support: - lead intake - discovery progression - scoring - recommendation generation - CRM sync - founder override - analytics and audit retrieval

API Design Principles

Keep business objects explicit and versioned.

Separate synchronous response APIs from event-driven workflow updates.

Ensure all AI-generated outputs can be traced to model version and logic version.

Use structured request and response bodies.

Keep human override endpoints first-class, not as afterthoughts.

Base Objects

Lead

Discovery Session

Discovery Answer

Score Snapshot

Recommendation Snapshot

CRM Sync Result

Override Record

Outcome Record

Knowledge Version

37.1 API Authentication and Access Model

Recommended Access Types

Internal Service Token for backend-to-backend integrations

Role-based User Auth for admin, sales, founder, ops, CRM admin

Channel Auth for website bot, WhatsApp connector, and later voice stack

Recommended Roles

Admin

Sales User

Sales Head

Founder Reviewer

Ops User

CRM Admin

Read-Only Analytics User

Authorization Rules

Sales users can read and update assigned leads and discovery sessions

Founders and sales heads can override recommendations and scores

Admins can update knowledge logic, scoring thresholds, and service records

CRM Admins can manage sync configuration and duplicate detection rules

37.2 Lead Intake API

Endpoint

POST /api/v1/leads/intake

Purpose

Create or update an incoming lead from website, WhatsApp, email, phone, or manual entry.

Request Body

```
{
"source_channel": "website",
"lead_origin_type": "inbound",
"company_name": "Example Brand",
"contact_name": "Priya Sharma",
"designation": "Brand Manager",
"email": "priya@example.com",
"phone": "+919999999999",
"raw_message": "We want to do a skincare sampling campaign in Bangalore.",
"campaign_source": "google_ads",
"campaign_medium": "cpc",
"campaign_name": "sampling_q2"
}
```

Response Body

```
{
"lead_id": "LD-000124",
"matched_existing_lead": false,
"discovery_session_id": "DS-00987",
"classification_status": "pending",
"message": "Lead intake successful"
}
```

Rules

duplicate detection should run before creating a new lead

if confidence of duplicate match is high, update existing lead instead of creating new one

raw inbound message should be stored separately from structured summary

37.3 Lead Classification API

Endpoint

POST /api/v1/leads/{lead_id}/classify

Purpose

Classify service category, industry, probable objective, and priority context from existing lead data.

Response Body

{
"lead_id": "LD-000124",
"industry_primary": "Beauty / Skincare",
"service_category": "Product Sampling",
"sub_service_category": "IT Park Sampling",
"campaign_objective_primary": "Product Trial",
"confidence_score": 74,
"logic_version_used": "v1.0.3",
"model_version_used": "gpt-x.x"
}

Rules

classification should always preserve confidence and origin metadata

if classification confidence is low, discovery should remain broad until clarified

37.4 Discovery Session Create API

Endpoint

POST /api/v1/discovery-sessions

Purpose

Create a structured discovery session tied to a lead.

Request Body

{
"lead_id": "LD-000124",
"channel": "sales_copilot",
"initiated_by": "sales_user_17"
}

Response Body

{
"discovery_session_id": "DS-00987",
"lead_id": "LD-000124",

"status": "active"

}

37.5 Next-Best Question API

Endpoint

GET /api/v1/discovery-sessions/{discovery_session_id}/next-question

Purpose

Return the most relevant next question based on current field state.

Response Body

{

"question_id": "Q-112",

"question_text": "Approximately how many samples are you planning to deploy in phase 1?",

"question_type": "Quote Critical",

"reason": "Sample volume is required to estimate campaign scope and budget band.",

"field_to_populate": "sample_volume_estimate",

"priority": 1

}

Rules

must not return a question already confirmed unless clarification flag exists

should include plain-language reason so the salesperson understands why it matters

37.6 Discovery Answer Capture API

Endpoint

POST /api/v1/discovery-sessions/{discovery_session_id}/answers

Purpose

Capture a prospect answer and update structured fields.

Request Body

{

"question_id": "Q-112",

"answer_text": "We are planning around 10,000 units for the first phase.",

"captured_by": "sales_user_17",

"answer_source": "human_entered"

}

Response Body

{

"lead_id": "LD-000124",

"updated_fields": [

{

"field": "sample_volume_estimate",

"value": 10000,

"status": "confirmed"

}

],

"score_recalculated": true,

"proposal_readiness_status": "Ready for Budgetary Estimate"

}

Rules

every captured answer should generate field updates, audit records, and optional score recalculation

AI-normalized values should preserve original answer text for traceability

37.7 Discovery Summary API

Endpoint

GET /api/v1/leads/{lead_id}/discovery-summary

Purpose

Return a structured summary of all known, inferred, and missing commercial information.

Response Body

{

"lead_id": "LD-000124",

"summary": "Beauty brand exploring Bangalore IT park sampling for skincare launch within 30 days.",

"confirmed_fields": {

"industry_primary": "Beauty / Skincare",

"service_category": "Product Sampling",

"sample_volume_estimate": 10000

},

"inferred_fields": {

"budget_band": "3L–10L"

},

"missing_fields": [

"exact touchpoint split",

"branding scope"

]

}

37.8 Score Calculation API

Endpoint

POST /api/v1/leads/{lead_id}/score

Purpose

Recalculate all component scores and total lead score.

Response Body

{

"lead_id": "LD-000124",

"fit_score": 22,

"authority_score": 11,

"urgency_score": 12,

"budget_score": 10,

"completeness_score": 8,

"strategic_value_score": 6,

"feasibility_score": 7,

"total_lead_score": 76,

"lead_priority_band": "Qualified Priority",

"confidence_score": 81,

"confidence_band": "High"

}

Rules

every scoring response must include component-level outputs

score recalculation should happen automatically after critical field changes and optionally on demand

37.9 Recommendation API

Endpoint

POST /api/v1/leads/{lead_id}/recommendation

Purpose

Generate service, touchpoint, and next-step recommendation.

Response Body

{

"lead_id": "LD-000124",

"recommended_service_mix": [

"IT Park Sampling",
"Mall Sampling"
],
"recommended_campaign_model": "Pilot",
"budget_band": "3L–10L",
"timeline_band": "Within 30 Days",
"recommended_case_studies": [
"CS-101",
"CS-117"
],
"risks": [
"Branding scope not yet defined"
],
"assumptions": [
"Single-city phase 1"
]
}

Rules

should not generate unsupported service recommendations

must preserve assumptions explicitly

low confidence recommendations should include human review flag

37.10 Proposal Readiness API

Endpoint

GET /api/v1/leads/{lead_id}/proposal-readiness

Purpose

Return readiness status for capability deck, budgetary estimate, or scoped proposal.

Response Body

{
"lead_id": "LD-000124",
"proposal_readiness_status": "Ready for Budgetary Estimate",
"quote_readiness_status": "Needs More Discovery",
"missing_critical_fields": [
"branding scope"
],

"recommended_next_action": "Clarify branding requirement before final proposal"

}

37.11 CRM Sync API

Endpoint

POST /api/v1/leads/{lead_id}/sync-crm

Purpose

Push or update lead intelligence in CRM.

Response Body

{

"lead_id": "LD-000124",

"crm_record_id": "CRM-77812",

"sync_status": "success",

"updated_fields_count": 21,

"owner_assigned": "Vidhya",

"sla_priority": "High"

}

Rules

all sync attempts should create audit records

CRM sync failures should create retryable system events

37.12 Founder Override API

Endpoint

POST /api/v1/leads/{lead_id}/override

Purpose

Allow founder or sales head to modify scores, routing, service recommendations, or readiness states.

Request Body

{

"override_type": "service_correction",

"changed_fields": {

"sub_service_category": "Mall Sampling"

},

"reason": "Better TG fit for premium skincare positioning",

"overridden_by": "founder_user_01"

}

Response Body

{
"lead_id": "LD-000124",
"override_record_id": "OV-6612",
"status": "applied",
"learning_signal_created": true
}

Rules

all overrides must capture before/after values and reason

override should trigger refreshed summary and optional re-score

37.13 Outcome Logging API

Endpoint

POST /api/v1/leads/{lead_id}/outcome

Purpose

Store win/loss and outcome reason for learning and analytics.

Request Body

{
"outcome_status": "won",
"outcome_reason": "Budget aligned and pilot approved",
"recorded_by": "sales_head_01"
}

37.14 Knowledge Management APIs

Recommended Endpoints

POST /api/v1/knowledge/services

PATCH /api/v1/knowledge/services/{service_id}

POST /api/v1/knowledge/questions

PATCH /api/v1/knowledge/questions/{question_id}

POST /api/v1/knowledge/industries

POST /api/v1/knowledge/case-studies

POST /api/v1/knowledge/versions/publish

POST /api/v1/knowledge/versions/rollback

Rules

only approved roles can publish new logic version

version metadata must be preserved on all production decisions

37.15 Analytics APIs

Recommended Endpoints

GET /api/v1/analytics/lead-quality

GET /api/v1/analytics/question-quality

GET /api/v1/analytics/override-patterns

GET /api/v1/analytics/conversion-by-score-band

GET /api/v1/analytics/discovery-completeness

37.16 Error Handling Standards

Common Error Types

validation_error

duplicate_lead_conflict

knowledge_version_not_found

low_confidence_block

crm_sync_failure

permission_denied

unsupported_service_path

Error Response Format

```
{
"error_code": "validation_error",
"message": "service_category is required for scoring",
"details": {
"field": "service_category"
}
}
```

38. Event Schema Specification

This section defines the event-driven model for AIM Entity Brain.

The event layer should power: - auditability - retries - analytics - downstream integrations - async workflow automation

Event Design Principles

Every material lead-state change should emit an event.

Events should be idempotent-friendly.

Events should include source, timestamp, lead ID, and version metadata.

Failure-prone external integrations should be event-driven where possible.

Standard Event Envelope

```
{
```

"event_id": "EV-90001",
"event_type": "lead.created",
"occurred_at": "2026-04-04T12:15:00Z",
"lead_id": "LD-000124",
"source": "website_bot",
"logic_version_used": "v1.0.3",
"model_version_used": "gpt-x.x",
"payload": {}
}

38.1 Core Lead Events

lead.created

When a new lead record is created.

lead.updated

When major lead data is updated.

lead.matched_existing

When intake resolves to an existing lead rather than creating a new one.

lead.assigned

When owner/team assignment occurs.

lead.escalated

When founder or sales-head review is triggered.

lead.disqualified

When lead is marked low-fit or unviable.

38.2 Discovery Events

discovery.started

When a discovery session begins.

discovery.question.served

When next-best question is generated and shown.

discovery.answer.captured

When an answer is stored.

discovery.field.updated

When a structured field changes.

discovery.summary.generated

When a summary is refreshed.

discovery.completed

When minimum discovery threshold is reached.

38.3 Scoring and Recommendation Events

score.calculated

When score snapshot is recalculated.

confidence.updated

When confidence changes materially.

recommendation.generated

When solution recommendation is produced.

proposal.readiness.changed

When readiness status changes.

38.4 CRM and Workflow Events

crm.sync.requested

When CRM sync is triggered.

crm.sync.succeeded

When CRM sync succeeds.

crm.sync.failed

When CRM sync fails.

task.created

When follow-up or review task is created.

sla.priority.changed

When SLA classification changes.

38.5 Human Review Events

override.created

When a founder or sales head override is submitted.

override.applied

When override has been written into active lead state.

review.approved

When escalation is approved without changes.

review.reassigned

When ownership or path is changed in review.

38.6 Learning and Outcome Events

outcome.recorded

When win/loss is captured.

analytics.snapshot.generated

When periodic analytics jobs are run.

knowledge.version.published

When new logic goes live.

knowledge.version.rolled_back

When version rollback happens.

38.7 Example Event Payloads

Example: score.calculated

{
"event_id": "EV-90002",
"event_type": "score.calculated",
"occurred_at": "2026-04-04T12:30:00Z",
"lead_id": "LD-000124",
"source": "scoring_engine",
"logic_version_used": "v1.0.3",
"payload": {
"fit_score": 22,
"authority_score": 11,
"urgency_score": 12,
"budget_score": 10,
"completeness_score": 8,
"strategic_value_score": 6,
"feasibility_score": 7,
"total_lead_score": 76,
"lead_priority_band": "Qualified Priority"
}
}

Example: lead.escalated

{
"event_id": "EV-90003",
"event_type": "lead.escalated",
"occurred_at": "2026-04-04T12:35:00Z",
"lead_id": "LD-000124",
"source": "orchestrator",
"payload": {

"reason": "High value but low confidence",

"recommended_reviewer_role": "Founder Reviewer"

}

}

38.8 Event Consumers

Recommended Consumers

CRM integration worker

analytics worker

notification service

founder review queue service

task creation service

audit log service

model evaluation pipeline

38.9 Retry and Failure Handling

Recommended Rules

CRM sync failures should retry with backoff

external messaging failures should be logged and retried separately

score/recommendation failures should not corrupt existing lead state

failed async consumers should push to dead-letter queue after retry threshold

39. Pilot Rollout Plan

This section defines how AIM should launch the first working version of Entity Brain.

The goal is not to automate everything at once. The goal is to prove business value safely and quickly.

Pilot Principles

Start with high-frequency, commercially important services.

Use internal sales copilot first.

Keep founder feedback tightly looped during the pilot.

Measure both system accuracy and business impact.

Expand only after question quality and routing quality stabilize.

39.1 Recommended Pilot Scope

Phase 1 Pilot Services

Start with the services that most directly affect AIM’s current commercial motion: 1. Product Sampling - IT Park Sampling - RWA / Apartment Sampling - Mall Sampling - In-Store / Retail Sampling 2. Brand Activation - Kiosk-Based Activation - Product Demo / Trial Booth 3. Transit / Mobile Outreach - LED Van Campaign

Why These First

they are core to AIM’s sales motion

they have repeatable commercial logic

they frequently require founder intervention today

they are good training ground for discovery quality

39.2 Recommended Pilot Users

Internal Users

1 Sales Head / reviewer

2 Sales users

1 Founder reviewer

1 Ops reviewer

1 Product / admin owner

Suggested AIM Pilot Roles

Sales Head: oversight and override review

Sales Users: primary copilot users during discovery

Founder: weekly quality review and escalations

Ops: feasibility validation feedback

Admin/Product: maintain knowledge updates and scoring thresholds

39.3 Recommended Pilot Channels

Start With

manual lead entry through sales copilot

website inbound leads summarized into system

WhatsApp inbound leads processed through structured intake

Defer Initially

fully autonomous public chatbot

voice outbound automation

automated proposal generation without review

39.4 Pilot Success Criteria

Operational Success Metrics

reduction in founder interruptions per lead

increase in discovery completeness score

reduction in average time to proposal readiness

reduction in missing critical fields at proposal stage

Quality Metrics

duplicate question rate below agreed threshold

score accuracy vs sales-head review

recommendation usefulness rating from sales team

feasibility flag accuracy from ops review

Commercial Metrics

improved lead prioritization quality

faster response on high-intent leads

improved proposal conversion on qualified leads

39.5 Pilot KPI Targets (Recommended Starting Benchmarks)

These can be tuned once AIM sets a baseline.

39.6 Pilot Rollout Stages

Stage 0: Preparation (Week 1–2)

finalize pilot services

finalize scoring thresholds

finalize question banks

finalize CRM field map

onboard pilot users

define feedback review cadence

Stage 1: Internal Copilot Shadow Mode (Week 3–4)

sales team continues normal process

system runs in parallel and suggests questions/scores

compare system suggestions against actual sales actions

log gaps and override patterns

Stage 2: Assisted Live Mode (Week 5–6)

sales team actively uses copilot during discovery

founder reviews escalated leads

ops validates feasibility flags

CRM sync used for pilot leads

Stage 3: Controlled Operational Mode (Week 7–8)

selected website and WhatsApp leads enter through system

discovery summaries auto-generated

scoring/routing used for working decisions

weekly logic tuning based on outcomes

Stage 4: Pilot Review and Expansion Decision (Week 9)

review business metrics

review override patterns

review question quality

review routing accuracy

decide go/no-go for discovery bot expansion

39.7 Pilot Governance Cadence

Daily

review sync failures

review escalations

review major overrides

Weekly

founder review of top escalations

sales feedback review

ops feedback review

scoring and question quality review

End of Pilot

compare baseline vs pilot performance

identify service gaps

finalize phase 2 expansion plan

39.8 Recommended Pilot Review Template

Each week, review: - number of pilot leads processed - score distribution - confidence distribution - average completeness score - number of escalations - number of overrides - most common missing fields - most common weak questions - most common misclassification issues - proposal-readiness accuracy - notable wins/losses

39.9 Expansion Criteria After Pilot

Expand to next phase only if: - discovery quality is stable - duplicate questioning is low - sales users trust the copilot - founder override rate is reducing meaningfully - CRM sync reliability is acceptable - recommendation usefulness is consistently positive

Phase 2 Expansion Candidates

more retail branding workflows

more hybrid campaign paths

customer-facing discovery bot

Phase 3 Expansion Candidates

voice prospecting engine

semi-automated outbound qualification

deeper proposal automation

39.10 Recommended Ownership Model

39.11 Recommended Next Document

After this implementation specification, the next best documents are: 1. Figma wireframes or clickable prototype for the key screens 2. Engineering task breakdown by module 3. Data migration / knowledge ingestion plan 4. Pilot operating SOP for sales and founder reviewers

These will take AIM from planning into active build execution.

40. Engineering Task Breakdown by Module

This section translates the product specification into executable workstreams for engineering, product, and operations.

The purpose of this breakdown is to help AIM: - estimate build effort - allocate ownership across backend, frontend, product, and integrations - sequence the build properly - avoid building UI before core logic and data structures exist

Workstream Design Principles

Build core data and logic before advanced UI.

Separate platform foundations from user-facing features.

Deliver the internal sales copilot first.

Keep every workstream testable in isolation.

Treat knowledge quality as a product dependency, not just content work.

40.1 Workstream Overview

40.2 Workstream 1: Platform Foundation

Objective

Create the underlying application infrastructure needed for secure, traceable, versioned operations.

Key Tasks

set up environments: dev, staging, production

implement auth and RBAC

define core database schema

set up audit logging framework

set up file/retrieval storage connectors

set up event bus / queue mechanism

define API versioning approach

implement observability basics (logs, metrics, errors)

Deliverables

environment setup checklist

RBAC matrix

initial database schema migrations

logging and monitoring setup

API gateway/base framework

Dependencies

none, this starts first

Acceptance Criteria

authenticated internal users can access system based on role

all API calls are logged with user/service identity

core objects can be persisted in database

40.3 Workstream 2: Knowledge Core Implementation

Objective

Build the structured knowledge layer and admin-ready data foundations.

Key Tasks

implement services table and CRUD APIs

implement sub-services table and relationships

implement industry playbook table and CRUD APIs

implement discovery question table with conditional fields

implement case-study metadata model

implement scoring config tables

implement knowledge versioning model

build import templates for structured data uploads

Deliverables

service and sub-service APIs

question bank APIs

industry playbook APIs

case-study metadata APIs

versioning schema

admin import template sheets

Dependencies

Platform Foundation

Acceptance Criteria

admin can create and retrieve structured service and question records

knowledge version can be tagged and retrieved by live engine

inactive knowledge does not appear in live recommendations

40.4 Workstream 3: Retrieval and Knowledge Access Layer

Objective

Enable the system to fetch relevant long-form context such as case studies, SOPs, and proposal archives.

Key Tasks

define retrieval corpus types

build document ingestion pipeline for approved files

tag documents with service/industry metadata

implement retrieval APIs

support filtered retrieval by service, industry, geography, and objective

store retrieval trace metadata alongside outputs

Deliverables

retrieval corpus structure

metadata schema

filtered retrieval endpoint

retrieval trace logging

Dependencies

Platform Foundation

Knowledge Core

Acceptance Criteria

system can retrieve relevant case studies based on service and industry filters

retrieval results include source metadata for auditability

40.5 Workstream 4: Orchestration Engine

Objective

Build the decision layer that runs classification, questioning, scoring, and recommendations.

Key Tasks

implement lead classification service

implement field-state manager

implement next-best-question selector

implement duplicate-question prevention logic

implement scoring engine

implement confidence engine

implement recommendation engine

implement proposal-readiness engine

implement escalation rules

Deliverables

orchestrator service

field-state logic

question selection service

scoring service

recommendation service

readiness service

Dependencies

Knowledge Core

Retrieval Layer

CRM field mapping

Acceptance Criteria

system can generate next-best question based on lead state

score updates when critical fields change

recommendation output includes assumptions and risks

low-confidence high-value leads escalate correctly

40.6 Workstream 5: Lead and Discovery APIs

Objective

Expose the engine through stable APIs for UI and integrations.

Key Tasks

build lead intake endpoint

build lead classification endpoint

build discovery session create endpoint

build answer capture endpoint

build score and recommendation endpoints

build proposal-readiness endpoint

build override endpoint

build outcome logging endpoint

Deliverables

API contracts implemented

API validation layer

API error handling and response standards

Dependencies

Orchestration Engine

Platform Foundation

Acceptance Criteria

all critical API flows work in staging

APIs return structured objects matching the contract spec

validation errors are explicit and recoverable

40.7 Workstream 6: CRM & Workflow Integration

Objective

Push lead intelligence into CRM and trigger assignment/action workflows.

Key Tasks

implement CRM create/update sync

implement duplicate lead handling logic

implement owner assignment rules

implement task creation rules

implement SLA tagging

implement sync retry handling and error logging

implement event-triggered workflow updates

Deliverables

CRM sync service

workflow task service

owner assignment engine

SLA priority logic

Dependencies

Lead and Discovery APIs

Event Schema

CRM field mapping

Acceptance Criteria

pilot leads sync into CRM with mapped structured fields

sync failures are logged and retryable

owner assignment follows routing rules

40.8 Workstream 7: Sales Copilot Frontend

Objective

Create the primary working interface for internal sales usage.

Key Tasks

build Lead Intelligence Dashboard UI

build Live Discovery Assistant UI

build score/confidence panels

build missing-field tracker UI

build summary and recommendation cards

build action buttons for assign, escalate, rescore, sync

Deliverables

sales copilot screens

responsive layouts for desktop use

state management for live discovery

Dependencies

Lead and Discovery APIs

scoring and recommendation outputs

Acceptance Criteria

salesperson can complete a structured discovery flow from one interface

UI shows confirmed vs inferred vs missing fields clearly

next-best question can be used during live calls

40.9 Workstream 8: Founder Review Frontend

Objective

Create the escalation review and override interface.

Key Tasks

build review queue screen

build Founder Review Panel

build override form and reason capture

build before/after comparison UI

build override history display

Deliverables

founder review queue

override interaction flow

audit-friendly change display

Dependencies

override APIs

score and recommendation APIs

Acceptance Criteria

founder can review and override an escalated lead quickly

every override is captured with reason and before/after state

40.10 Workstream 9: Knowledge Admin Frontend

Objective

Allow controlled maintenance of services, questions, scoring, and knowledge versions.

Key Tasks

build service management screens

build industry playbook screens

build question-bank editor

build scoring config editor

build publish/rollback version controls

build case-study metadata management interface

Deliverables

admin console for knowledge updates

publish and rollback workflow

Dependencies

Knowledge Core APIs

auth and role controls

Acceptance Criteria

authorized admin can update logic without engineering support

published logic version is visible to live engine and audit logs

40.11 Workstream 10: Analytics, Audit, and Evaluation

Objective

Measure system quality and pilot business impact.

Key Tasks

build lead-quality analytics

build override analytics

build discovery completeness analytics

build question-quality analytics

build conversion-by-score dashboards

build audit trail views

implement model trace storage for major decisions

Deliverables

pilot analytics dashboard

audit export/reporting capability

quality monitoring views

Dependencies

event schema

outcome logging

overrides

Acceptance Criteria

pilot team can review weekly quality and impact metrics

every major decision state has trace metadata available

40.12 Workstream 11: QA, Testing, and Evaluation Harness

Objective

Validate that the system behaves reliably across real AIM scenarios.

Key Tasks

create scenario test library by service and industry

create expected-answer and expected-question test cases

build regression checks for score/routing logic

build duplicate-question test set

build misfit lead test set

run founder-reviewed evaluation cycles

Deliverables

scenario library

acceptance test checklist

regression test suite

pilot issue triage template

Dependencies

all major modules

Acceptance Criteria

core scenarios pass acceptance checks before live pilot expansion

repeated regressions are visible before release

40.13 Suggested Sprint-Level Build Sequence

Sprint A

Platform Foundation

base database schema

auth and roles

event envelope setup

Sprint B

Knowledge Core APIs

import templates

service and question models

Sprint C

Orchestration basics

classification

field-state tracking

next-best question service

Sprint D

scoring engine

confidence engine

recommendation engine

readiness engine

Sprint E

lead/discovery APIs

CRM sync basics

owner assignment

Sprint F

Sales Copilot UI

Lead Intelligence Dashboard

Live Discovery Assistant

Sprint G

Founder Review UI

override flow

analytics basics

Sprint H

hardening, QA, pilot support, weekly logic tuning

40.14 Resourcing Recommendation

Minimum Practical Product Team

1 Product Owner / Product Manager

1 Backend Engineer

1 Frontend Engineer

1 Full-stack or Integration Engineer

1 QA / Test Engineer (shared is acceptable initially)

1 Knowledge Ops / Product Admin

1 Founder / Sales Head reviewer for weekly logic tuning

Optional but Valuable

1 AI / Prompt / Eval specialist

1 Data analyst for pilot measurements

40.15 Build Risk Notes

Likely Risk Areas

weak initial knowledge quality

over-complex orchestration too early

CRM sync mismatch with existing workflow

sales UI becoming too heavy for live usage

lack of consistent override reviews

Recommended Mitigation

keep pilot scope narrow

build observable state and logs first

tune on real lead scenarios weekly

keep human override easy and visible

41. Knowledge Ingestion Plan

This section defines how AIM should convert existing founder knowledge, case studies, service know-how, and past assets into usable Entity Brain knowledge.

The goal is to avoid a common failure mode: uploading lots of documents but not creating usable decision intelligence.

Ingestion Principles

Do not treat raw documents as the final brain.

Normalize critical knowledge into structured entities.

Preserve source links and provenance for every ingested fact.

Separate evergreen logic from temporary campaign-specific data.

Use founder review to validate the first structured versions.

41.1 Knowledge Source Categories

Structured Knowledge Sources

service lists

pricing frameworks

deliverable templates

approval matrices

routing rules

scoring rules

CRM fields

Semi-Structured Sources

proposals

SOWs

capability decks

case study decks

service one-pagers

questionnaire sheets

Unstructured Sources

founder voice notes or explanations

call transcripts

WhatsApp discussions

email threads

internal notes

meeting summaries

Operational Sources

execution SOPs

permission notes

city-level constraints

staffing assumptions

turnaround benchmarks

41.2 What Must Be Structured First

The first structured ingestion wave should prioritize: 1. services and sub-services 2. discovery questions 3. quote-critical inputs 4. feasibility-critical inputs 5. scoring logic 6. routing rules 7. high-value case studies 8. common objections and good responses

This is more important than bulk-importing every old document.

41.3 Ingestion Pipeline Stages

Stage 1: Inventory

Collect and list all existing knowledge assets.

Tasks

create source inventory spreadsheet

identify owner of each source

classify source type

tag source freshness

tag source business relevance

Output

A master inventory of AIM knowledge assets.

Stage 2: Prioritization

Decide what should be ingested first.

Priority Order

high-frequency services

current sales-useful documents

repeatable pricing and discovery logic

proven case studies

founder explanations of nuanced commercial decisions

Output

Ingestion priority backlog.

Stage 3: Extraction

Extract commercially relevant facts and patterns from sources.

Tasks

identify service definitions

identify required questions

identify pricing drivers

identify feasibility dependencies

identify common misfit cases

identify objections and winning pitch angles

identify scoring signals

Output

Raw extracted insight sheets by source.

Stage 4: Normalization

Convert extracted insights into structured objects.

Convert Into

service records

question bank records

case-study records

scoring config records

objection records

proposal module records

feasibility notes

Output

Structured import-ready data.

Stage 5: Validation

Have founder / sales head / ops validate structured data.

Validation Focus

is this commercially true?

is anything important missing?

is this outdated?

does this apply generally or only in specific cases?

Output

Approved version 1 structured knowledge pack.

Stage 6: Publication

Push approved knowledge to live/staging environment.

Output

Published knowledge version with changelog.

41.4 Knowledge Inventory Template

Recommended Columns

source_id

source_name

source_type

owner

service_tags

industry_tags

document_date

current_relevance

ingestion_priority

status

notes

Recommended Status Values

Not Reviewed

Prioritized

Extracted

Normalized

Validated

Published

Archived

41.5 Founder Knowledge Capture Plan

A large part of AIM’s advantage lives in founder reasoning, not documents.

Recommended Capture Methods

structured founder interviews by service

scenario-based workshops

win/loss debrief capture

proposal review deconstruction

override explanation logging during pilot

Best Format for Capture

For each service, ask founders to explain: - when this service is the right fit - when it is the wrong fit - what questions they ask first - what information they must know before quoting - what usually goes wrong - what makes a lead exciting but risky - what they would recommend instead in edge cases

Output

Founder reasoning sheets that can be normalized into rules and question banks.

41.6 Service-by-Service Ingestion Template

For each active service, capture the following: - service name - service description - ideal use cases - non-ideal use cases - best-fit industries - key target audiences - mandatory quote inputs - mandatory feasibility inputs - pricing drivers - common objections - recommended pitch angles - supporting case studies - risk notes - common substitutions or alternatives

This template should be completed before activating a service in pilot scope.

41.7 Case Study Ingestion Template

For each case study, capture: - case_study_id - client category - industry - service used - objective - target audience - geography - campaign scale - execution summary - outcome/result - lessons learned - where this case study is useful in sales - proof assets available

Important Rule

Do not store case studies only as PDFs or slides. Create metadata and structured tags first.

41.8 Proposal and SOW Ingestion Guidance

Past proposals and SOWs are valuable, but they should not be imported blindly.

Extract Only

service scope patterns

exclusions patterns

pricing drivers

deliverable blocks

assumptions patterns

client-specific modifications

Do Not Reuse Blindly

outdated pricing

one-off exceptional commercial concessions

old timelines that no longer reflect ops reality

custom clauses from unusual clients unless explicitly tagged

41.9 Objection and Pitch-Angle Ingestion Plan

The Entity Brain should know not just what AIM sells, but how AIM sells it.

Extract and Structure

common objections by service

common objections by industry

strong responses that work

proof points needed to support the response

when to shift to pilot-first recommendation

when to reposition the service mix

Example Tags

budget objection

timeline objection

feasibility objection

“why this touchpoint” objection

attribution objection

trust / credibility objection

41.10 Ops and Feasibility Knowledge Ingestion

This is critical so sales logic stays grounded.

Capture

permission dependencies by touchpoint

lead-time norms by service

production/fabrication constraints

manpower assumptions

city-specific constraints

compliance or handling considerations

reporting limitations

Why It Matters

Without this layer, the brain will oversell and under-warn.

41.11 Suggested Ingestion Sequence for AIM

Wave 1: Pilot-Critical Knowledge

Product Sampling

IT Park Sampling

RWA Sampling

Mall Sampling

In-Store Sampling

Kiosk Activation

LED Van

related case studies

related objections

related feasibility notes

Wave 2: Expansion Knowledge

retail branding

hybrid solutions

workplace activation variants

college and gym expansions

Wave 3: Advanced Learning Knowledge

call transcripts

win/loss notes

founder override logs

response quality patterns

41.12 Ingestion Roles and Ownership

41.13 Quality Checks for Ingested Knowledge

Before publishing a knowledge pack, confirm: - the service definition is current - the question set is not repetitive - quote inputs are sufficient but not excessive - feasibility notes are grounded in real ops constraints - case-study tags are accurate - scoring signals are commercially sensible - outdated pricing or one-off exceptions are excluded or clearly tagged

41.14 Knowledge Freshness Policy

Recommended Review Frequency

service logic: monthly or when service changes

pricing drivers: monthly or on commercial change

case studies: as new ones become available

feasibility rules: whenever ops constraints change

scoring logic: weekly during pilot, then monthly

Freshness Labels

Current

Needs Review

Archived

Historical Reference Only

41.15 Recommended First 30-Day Ingestion Plan

Week 1

build source inventory

prioritize pilot services

define ingestion templates

Week 2

extract and normalize pilot service logic

capture founder reasoning for pilot services

capture top 10–20 questions per pilot service

Week 3

ingest top case studies and objections

ingest feasibility constraints

validate with founder and ops

Week 4

publish v1 knowledge pack

begin pilot usage

start override-driven refinement cycle

41.16 Common Ingestion Mistakes to Avoid

uploading decks without extracting structured logic

mixing outdated and current pricing assumptions

storing founder insights only in free-text notes

failing to distinguish service rules from client-specific exceptions

skipping ops validation

activating too many services before the pilot logic is stable

41.17 Recommended Next Document

After this engineering breakdown and knowledge ingestion plan, the next strongest documents are: 1. Pilot Operating SOP for Sales, Founder Review, and Ops 2. Figma wireframe prompt / UI spec for prototype creation 3. Engineering estimation sheet by workstream and sprint

These will move AIM from planning into execution governance.

42. Pilot Operating SOP

This section defines how AIM should operate the Entity Brain during the pilot.

The purpose of this SOP is to ensure that the pilot is not treated as only a software test. It must function as an operating system test across sales, founder review, ops validation, and product/admin tuning.

SOP Principles

Sales should use the copilot during real discovery, not only after the call.

Founder review should focus on high-value ambiguity, not routine lead handling.

Ops should validate feasibility signals before overpromising becomes a pattern.

Every override and correction should improve the system.

Weekly review must convert pilot observations into logic updates.

42.1 Pilot Roles and Responsibilities

42.2 Daily Operating Flow

Step 1: Lead Intake

All pilot leads should enter through one of these routes: - direct intake into sales copilot - website lead synced into system - WhatsApp inquiry entered or connected into system

Sales User Action

open or create lead in system

review initial classification

confirm obvious identity details

start discovery session

System Action

create or update lead

classify probable service and industry

begin discovery state

suggest next-best question

42.3 Sales Discovery SOP

When to Use Copilot

Sales should use the copilot during: - first discovery call - WhatsApp clarification chat - email-based requirement clarification - follow-up call before proposal preparation

Sales User Must Do

review the lead summary before speaking

ask suggested questions where relevant

mark answers as confirmed when prospect states them clearly

correct inferred fields if needed

avoid skipping critical questions without reason

check proposal-readiness before asking for internal pricing/proposal prep

Sales User Must Not Do

ignore missing critical fields and still request final proposal

override recommendation without reason

assume inferred fields are confirmed facts

promise feasibility where the system has flagged risk without validation

Minimum Sales Checklist Before Moving Lead Forward

objective captured

target audience captured

geography captured

timeline captured in at least band form

service direction reasonably clear

budget orientation captured or at least discussed

major feasibility blockers flagged if known

42.4 Founder Review SOP

When a Lead Must Be Escalated

Escalate when: - score is high but confidence is low - lead is strategically valuable or marquee - service fit is ambiguous across multiple AIM services - client is pushing for final pricing without enough discovery - feasibility risk is high due to timeline, permissions, or category sensitivity - salesperson is unable to determine commercial direction confidently

Founder Reviewer Must Do

review system summary, score, confidence, and missing fields

assess whether the issue is discovery quality, service fit, or feasibility

approve, edit, or override the system recommendation

record override reason in clear business language

identify whether logic update is needed for similar future cases

Founder Reviewer Must Not Do

rewrite the whole brief without preserving why the system was wrong

bypass logging because the lead seems obvious

let urgent but low-feasibility leads proceed without caution notes

Target Review Time

For standard escalations, founder review should ideally be completed in a short focused window, with a practical goal of rapid turnaround during business hours.

42.5 Ops Validation SOP

When Ops Should Be Involved

Ops should validate when: - permissions are a likely blocker - timeline is aggressive - product handling/storage requirements are unclear - branding/fabrication scope affects feasibility - multi-touchpoint complexity is high - retail or venue approvals are required

Ops Reviewer Must Do

review the relevant lead summary and risk flags

confirm or correct feasibility assumptions

identify hidden ground constraints

flag unrealistic commitments before proposal stage

suggest safer execution model where needed

Ops Reviewer Output

feasible

feasible with caution

not feasible without changes

needs more information

This output should be captured in system notes and reflected in feasibility score updates.

42.6 Sales Head Monitoring SOP

Sales Head Responsibilities

review the day’s high-priority leads

review leads stuck in discovery too long

monitor whether sales team is using the copilot properly

review major override patterns

identify where training vs logic improvement is needed

Daily Review Focus

high-priority leads not yet assigned

high-score leads with missing critical fields

repeated founder escalations of the same kind

low-confidence recommendations on important leads

42.7 Product/Admin Operating SOP

Daily Responsibilities

review system errors

review CRM sync failures

review duplicate lead issues

review major logic failures reported by users

track unresolved pilot bugs

Weekly Responsibilities

prepare pilot metrics summary

prepare top override patterns

prepare top weak-question patterns

prepare top misclassification patterns

prepare knowledge update recommendations

Product/Admin Must Do

maintain issue log with severity

tag issues as product, knowledge, scoring, ops, CRM, or training

ensure approved logic changes move through version control

42.8 Daily Cadence

Start of Day

Sales Head / Product Admin should review: - open high-priority leads - pending escalations - sync failures - prior day unresolved issues

During Day

Sales users should: - use the copilot live during active discovery - escalate only when rule conditions are met - avoid offline notes that never enter the system

End of Day

Sales Head / Product Admin should review: - leads processed during the day - new overrides - leads stuck without next action - recurring missing fields

42.9 Weekly Review Cadence

A structured weekly review is mandatory during the pilot.

Participants

Founder Reviewer

Sales Head

Sales Users in pilot

Ops Reviewer

Product/Admin Owner

CRM Admin if sync issues are material

Weekly Review Agenda

total pilot leads processed

score distribution

confidence distribution

discovery completeness trends

top missing fields

top duplicate or weak questions

top founder overrides

top ops feasibility corrections

notable wins/losses from pilot leads

logic changes to approve for next version

Weekly Output

approved logic updates

training actions for sales users

CRM fixes if needed

list of scenarios to add to test harness

42.10 Lead Handling SOP by Priority Band

High Intent Priority

Sales User: - contact fast within SLA - complete discovery thoroughly - check readiness early

Sales Head: - monitor closely - step in if confidence is low or lead is strategically important

Founder: - review if escalated

Qualified Priority

Sales User: - proceed with standard discovery and proposal path - avoid rushing if critical data missing

Sales Head: - review only if stuck or if lead is large/complex

Nurture / Clarify

Sales User: - focus on missing information - do not move to detailed proposal early

Sales Head: - monitor if lead lingers too long without clarity

Low Priority / Disqualify

Sales User: - re-scope if possible - otherwise mark appropriately

Sales Head: - review only for special strategic exceptions

42.11 Override Handling SOP

When an Override Happens

The responsible reviewer must capture: - what the system said - what was changed - why it was changed - whether the problem was knowledge, scoring, workflow, or UI understanding

Override Categories

service classification correction

scoring correction

feasibility correction

routing correction

proposal-readiness correction

field accuracy correction

Rule

An override is not only an exception. It is a training signal. Every recurring override pattern must be reviewed in weekly logic tuning.

42.12 Proposal Stage Handoff SOP

Before a lead moves to proposal stage, the salesperson must verify: - proposal-readiness status is appropriate - required fields are captured - assumptions are visible - risks are visible - feasibility flags are reviewed if needed

Handoff Package Should Include

requirement summary

confirmed fields

inferred fields

missing but non-blocking fields

score summary

recommended service path

assumptions

risk flags

relevant case studies

This package should be visible to proposal owner or salesperson preparing the proposal.

42.13 CRM Hygiene SOP During Pilot

CRM Admin / Product Admin Must Monitor

duplicate leads

field mismatch between system and CRM

missing mandatory fields after sync

invalid enum values

assignment mismatches

failed tasks or SLA tags

Rule

CRM should remain the operational record, but Entity Brain should remain the decision layer. Neither should silently overwrite the other without auditability.

42.14 Training SOP for Sales Users

Before pilot start, sales users should be trained on: - what the system is trying to do - what confirmed vs inferred means - how to use next-best question suggestions - when to escalate - how to correct fields - how to avoid bypassing the system - how proposal-readiness differs from general interest

Training Format Recommended

one walkthrough session

one scenario-based practice session

one shadow-mode review session

42.15 Pilot Issue Classification SOP

Every issue raised during pilot should be tagged as one of the following: - Knowledge issue - Scoring issue - Question quality issue - CRM sync issue - UI usability issue - Routing issue - Feasibility logic issue - Training issue - Performance/latency issue

This helps avoid vague statements like “the system is not good” and turns feedback into fixable categories.

42.16 Pilot Success Review SOP

At the end of each pilot cycle, leadership should review: - whether founder dependency reduced - whether discovery quality improved - whether high-priority leads were identified earlier - whether feasibility issues were caught earlier - whether sales adopted the system properly - whether logic is stable enough to expand

Expansion Decision Options

expand to more services

expand to customer-facing discovery bot

continue internal-only tuning

pause and fix specific modules before expansion

42.17 Pilot SOP Checklist

Daily Checklist

new pilot leads entered through system

high-priority leads reviewed

pending escalations addressed

sync failures checked

overrides logged

Weekly Checklist

pilot metrics reviewed

top weak questions reviewed

top overrides reviewed

top feasibility corrections reviewed

logic changes approved or deferred

End-of-Pilot Checklist

baseline vs pilot comparison completed

expansion readiness assessed

v2 improvement backlog created

42.18 Recommended Next Document

After this Pilot Operating SOP, the next most useful document is: Figma Wireframe / Prototype Prompt Pack

That will allow AIM to turn this specification into actual screen concepts quickly for design and build alignment.

43. Figma Wireframe / Prototype Prompt Pack

This section converts the AIM Entity Brain product specification into design-ready prompts.

These prompts are intended for: - Figma AI - a product designer - a UI/UX freelancer - low-code UI prototyping tools - internal frontend teams creating first-pass wireframes

Prompt Pack Objective

Generate usable screen concepts for the first version of AIM Entity Brain with: - clean B2B SaaS layout - premium but functional UI - strong information hierarchy - fast decision support for sales and leadership - minimal clutter during live usage

Design Direction

Use a clean, data-driven, premium interface style aligned to AIM’s broader design language: - white or very light backgrounds - dark navy text - AIM blue accents - rounded cards - subtle shadows - clean spacing - high readability - clear chips, tags, and status indicators - dashboard-first layout - modern enterprise SaaS feel

Global UX Principles

Sales must understand a lead in under 30 seconds.

The interface must clearly separate confirmed, inferred, and missing information.

Score, confidence, and proposal-readiness must always be visible.

The UI must support live call usage without forcing too much scrolling.

Important actions must be obvious: ask next question, assign, escalate, override, sync, move to proposal.

AI-generated recommendations must always be visually separable from human-confirmed facts.

43.1 Global Design Prompt

Master Prompt

Design a premium B2B SaaS product called AIM Entity Brain, an AI-powered sales intelligence and discovery copilot for a marketing and activation company. The product helps sales teams qualify leads, ask the right next question, score opportunities, recommend services, identify missing information, and route high-priority leads correctly. The UI should feel modern, clean, premium, and data-driven, with white backgrounds, dark navy typography, AIM-blue accents, rounded cards, light borders, subtle shadows, clean chip-based statuses, and strong information hierarchy. The design must support live sales usage, founder review, and CRM-style workflow. Use a desktop-first layout with modular cards, right-side action panels, sticky score/status areas, and clear separation between confirmed data, inferred data, missing data, recommendations, and risk flags.

43.2 Screen Prompt: Lead Intelligence Dashboard

Prompt

Design a desktop web application screen for Lead Intelligence Dashboard inside AIM Entity Brain. This is the main screen used by sales teams to understand a lead quickly.

The page should include: - top header with lead name, company name, source channel, last updated time, assigned owner - prominent status chips for total lead score, confidence, proposal readiness, SLA priority, escalation flag - left column showing company and contact details, designation, industry, service category, sub-service, geography - central section showing requirement summary, target audience, timeline, budget band, campaign objective, preferred

touchpoints - a clear Missing Information card showing unresolved critical fields - a Recommended Next Action card with suggested next step and why it matters - a Solution Recommendation card showing recommended service mix, campaign model, budget band, and top assumptions - a Case Studies / Supporting Proof card - right-side sticky sidebar with score breakdown, confidence explanation, proposal readiness, and quick action buttons - bottom activity timeline with recent interactions, sync events, overrides, and discovery milestones

Use a premium enterprise SaaS style, clean sections, rounded cards, subtle blue highlights, and fast scannability. Make the most important commercial information visible above the fold.

Key UI Elements to Include

score donut or score bar for total lead score

chip-style status labels

collapsible cards for long summaries

quick action buttons: Open Discovery Assistant, Assign Owner, Escalate, Sync CRM, Move to Proposal

visually distinct labels for Confirmed / Inferred / Missing

43.3 Screen Prompt: Live Discovery Assistant

Prompt

Design a desktop screen for Live Discovery Assistant in AIM Entity Brain. This is used by a salesperson during a live call or WhatsApp/email clarification flow.

The screen should feel fast, focused, and minimal-clutter.

The page should include: - left panel showing live transcript or conversation notes - center panel showing Next-Best Question card prominently at the top - below it, a list of alternative questions if needed - a structured answer capture area with editable fields - a Field State Tracker showing confirmed fields, inferred fields, missing critical fields, and recently updated fields - a live Score & Confidence Update panel showing how new answers affect qualification - a Proposal Readiness module that updates live - quick actions to mark answer confirmed, edit field, skip question with reason, request founder review, generate summary - a compact reasoning explanation under the next-best question, like “This question is needed to estimate campaign scope and pricing band.”

Use clean cards, sticky top question area, a strong center-column interaction area, and a right-side intelligence sidebar. The interface should help a salesperson move smoothly without losing conversation flow.

Key UI Elements to Include

“Next Best Question” highlighted in blue-accent card

inline tags showing Quote Critical / Feasibility Critical / Scoring Critical

animated or clearly visible score changes after answer capture

distinct boxes for Confirmed, Inferred, Missing

a top-right “Escalate for Review” button

43.4 Screen Prompt: Founder Review Panel

Prompt

Design a premium review interface for Founder Review Panel in AIM Entity Brain. This screen is used by a founder or sales head to review high-value or low-confidence leads.

The screen should include: - top header with lead identity, company, strategic account badge if applicable, escalation reason - top row of score cards for total score, confidence, strategic value, feasibility, proposal readiness - left section with system-generated lead summary, discovery summary, missing information, and conversation highlights - central section with System Recommendation card showing recommended service mix, next step, assumptions, risks, and suggested owner - right section with Override Controls to edit fields, change service classification, change owner, adjust readiness, or mark nurture/disqualify - a before/after comparison view when override is being entered - override reason input box - override history section showing previous changes, timestamps, and who made them - bottom timeline for recent decisions and review actions

Make the interface feel high-trust, executive, and low-noise. Use premium card layouts, score emphasis, and clear visual distinction between system recommendation and human override.

Key UI Elements to Include

escalation banner at top

split view: System Recommendation vs Override

mandatory override reason field

approve, edit, and override buttons

audit timeline

43.5 Screen Prompt: Solution Recommendation Panel

Prompt

Design a focused screen for Solution Recommendation Panel in AIM Entity Brain. This screen helps sales understand what to propose and why.

The page should include: - primary recommendation card with recommended service mix and campaign model - secondary alternatives card showing 1–2 alternative service paths - “Why this fits” section listing the business reasons for recommendation - “Budget & Timeline Guidance” card with suggested bands - “Assumptions” card and “Exclusions / Risks” card - supporting case studies panel with thumbnails or compact cards - quick actions: Accept Recommendation, Send to Proposal Prep, Compare Alternatives, Escalate

The design should feel strategic and commercially intelligent rather than overly technical. Use elegant cards, concise bullets, strong hierarchy, and premium spacing.

Key UI Elements to Include

recommendation confidence chip

info cards for assumptions and exclusions

linked case-study cards

primary CTA button for moving to proposal stage

43.6 Screen Prompt: Knowledge Admin Panel

Prompt

Design an admin console screen for Knowledge Admin Panel in AIM Entity Brain. This panel is used to manage services, industry playbooks, discovery questions, scoring config, case studies, and logic versions.

The page should include: - left navigation for Services, Industries, Questions, Scoring, Case Studies, Versions - main content area showing a table or card list of the selected knowledge object - edit drawer or side panel for updating records - status chips for Active, Draft, Archived, Needs

Review - version management controls for publish and rollback - filters for service, industry, status, and owner - a top banner showing current live logic version

The design should feel like a modern internal admin SaaS panel: clean, organized, and efficient.

Key UI Elements to Include

searchable data tables

side-edit panel or modal

publish version button

rollback button

structured field forms

43.7 Screen Prompt: Weekly Pilot Analytics Dashboard

Prompt

Design a desktop analytics dashboard for AIM Entity Brain Pilot Review. This dashboard is used weekly by founder, sales head, and product/admin to assess pilot quality.

The page should include: - KPI cards for leads processed, average completeness score, duplicate question rate, override count, sync failure count, proposal-ready rate - charts for score distribution, confidence distribution, lead status distribution - a panel for top missing fields - a panel for top override categories - a panel for top weak questions or repeated question problems - a panel for conversion by score band - a table of high-risk pilot issues - a weekly action recommendation section

Use a premium analytics UI, clean charts, white background, dark text, restrained AIM-blue accents, rounded metric cards, and highly readable tables.

43.8 Low-Fidelity Wireframe Prompt Pack

Use these prompts when you want simple structural wireframes instead of polished UI.

Low-Fidelity Master Prompt

Create grayscale, low-fidelity wireframes for a B2B SaaS sales intelligence product called AIM Entity Brain. Focus on layout, information hierarchy, and workflow usability rather than visual polish. Use boxes, placeholders, labels, tables, cards, sidebars, tabs, and chips. Show desktop-first screen layouts for lead intelligence, live discovery, founder review, recommendation, and knowledge admin.

Low-Fidelity Screen Prompt: Lead Dashboard

Create a grayscale wireframe for a lead dashboard with a three-column layout: left for lead identity and company info, center for requirement summary and missing info, right for score, confidence, readiness, and action buttons. Include an activity timeline below.

Low-Fidelity Screen Prompt: Live Discovery Assistant

Create a grayscale wireframe for a live discovery screen with left transcript panel, center next-best question and answer capture area, and right field-state tracker with live score changes.

Low-Fidelity Screen Prompt: Founder Review

Create a grayscale wireframe for a founder review screen with escalation banner, summary area, system recommendation panel, override form, and audit timeline.

43.9 Clickable Prototype Flow Prompt

Prompt

Create a clickable prototype for AIM Entity Brain with the following flow: 1. user lands on Lead Intelligence Dashboard 2. clicks Open Discovery Assistant 3. sees next-best question and enters an answer 4. score and readiness update dynamically 5. user returns to dashboard and sees updated summary 6. user opens Solution Recommendation Panel 7. user chooses Escalate for Review 8. founder review screen opens with override controls 9. founder changes service path and submits override 10. dashboard updates with new recommendation and audit entry

The prototype should prioritize business workflow clarity over full UI polish.

43.10 Component Library Prompt

Prompt

Design a component library for AIM Entity Brain using a premium B2B SaaS design system. Include: - status chips - score cards - confidence indicators - summary cards - missing info alerts - field state badges for Confirmed / Inferred / Missing - side panels - activity timeline rows - editable table rows - recommendation cards - escalation banner - override modal - analytics KPI cards

Use consistent rounded corners, subtle shadows, navy typography, blue accents, clean grids, and high readability.

43.11 UX Copy Guidance for Prototype

Use short, professional labels and helpful assistant-style system text.

Suggested Label Examples

Lead Intelligence

Discovery in Progress

Recommended Next Step

Missing Critical Information

Proposal Readiness

High Intent Priority

Needs Human Review

Confirmed Information

Inferred Information

Escalation Reason

Recommended Service Mix

Why This Fits

Risks & Assumptions

Suggested Helper Text Examples

This question helps determine campaign scope and budget fit.

More information is needed before a scoped proposal can be prepared.

This lead is high-value, but confidence is low due to missing commercial details.

Feasibility should be validated before final commitment.

43.12 Recommended Prototype Build Order

Create design concepts in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel 6. Weekly Pilot Analytics Dashboard

This sequence matches the highest-value usage path for AIM.

43.13 Recommended Next Deliverables

After this prompt pack, the next strongest execution outputs are: 1. a Figma file or clickable prototype 2. an engineering estimation sheet by workstream 3. a knowledge ingestion tracker spreadsheet 4. a pilot-ready issue tracker template

At this point, AIM has enough specification depth to begin design, estimation, and phased build execution.

44. Knowledge Ingestion Operating Model

This section turns knowledge ingestion from a concept into a working operating model for AIM.

The goal is to make sure AIM can continuously convert: - founder knowledge - service know-how - case studies - proposals - SOWs - ops constraints - sales conversations - objections and rebuttals

into structured, versioned, usable Entity Brain knowledge.

Operating Model Principles

Ingestion is a recurring business process, not a one-time upload project.

Every important knowledge item should move through a defined workflow.

Nothing should become live without validation.

Every structured record must retain source provenance.

High-frequency commercial knowledge should be ingested first.

44.1 Knowledge Ingestion Workflow

Stage 1: Capture

Collect raw knowledge from founders, sales, ops, proposals, decks, and transcripts.

Stage 2: Inventory

List and tag the source with metadata.

Stage 3: Extract

Pull out commercially meaningful facts, patterns, conditions, and rules.

Stage 4: Normalize

Convert extracted points into structured entities.

Stage 5: Validate

Get service owner / founder / ops approval.

Stage 6: Publish

Push validated logic into active or draft knowledge version.

Stage 7: Monitor

Track where the ingested knowledge performs well or poorly in live usage.

Stage 8: Refresh

Update or retire stale knowledge.

44.2 Recommended Knowledge Repositories

AIM should maintain four distinct knowledge repositories.

Repository A: Structured Core Knowledge

Stores: - services - sub-services - discovery questions - scoring rules - routing rules - feasibility notes - objections - proposal modules

Repository B: Retrieval Knowledge

Stores: - case studies - decks - SOWs - proposal archives - transcripts - internal playbooks

Repository C: Working Draft Knowledge

Stores: - extracted but unvalidated records - founder interview notes - pending logic proposals - staging-only updates

Repository D: Historical / Archived Knowledge

Stores: - old logic versions - retired services - outdated pricing patterns - historical references

44.3 AIM-Specific Knowledge Domains to Ingest

Domain 1: Commercial Service Knowledge

what AIM sells

where each service fits

where it does not fit

what is required before quote

what is required before feasibility validation

Domain 2: Touchpoint Intelligence

IT parks

RWAs / apartments

malls

retail stores

colleges

gyms

LED vans

hybrid combinations

Domain 3: Industry Intelligence

FMCG

snacks / foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care

Domain 4: Sales Discovery Intelligence

must-ask questions

disqualifying signals

upsell signals

pilot vs rollout signals

budget discovery patterns

Domain 5: Delivery / Ops Intelligence

permissions

lead times

staffing assumptions

fabrication dependencies

city-level constraints

reporting realities

Domain 6: Case Study and Proof Intelligence

what proof to use for which lead

which results matter by category

what kind of case study helps which objection

Domain 7: Objection and Rebuttal Intelligence

budget objections

trust objections

timing objections

attribution objections

feasibility objections

“why this touchpoint” objections

44.4 Knowledge Item Types

Each ingested item should be classified into one of these types.

44.5 Detailed Source Inventory Template

Use this structure for every potential source.

44.6 Extraction Template by Source

When extracting from any source, capture the following.

44.7 Normalization Templates

A. Service Logic Normalization Template

service_name

sub_service_name

description

ideal_use_cases

non_ideal_use_cases

best_fit_industries

best_fit_audiences

mandatory_quote_inputs

44.8 Knowledge Validation Workflow

Validation Levels

Level 1: Content Validation

Checks whether the extracted content is understandable and correctly structured. Owner: Product/Admin

Level 2: Commercial Validation

Checks whether the logic matches real sales and founder thinking. Owner: Founder / Sales Head

Level 3: Feasibility Validation

Checks whether the guidance is operationally realistic. Owner: Ops Lead

Level 4: Publication Validation

Checks whether the item is ready for live logic versioning. Owner: Product/Admin + designated approver

Validation Status Options

Draft

Needs Commercial Review

Needs Feasibility Review

Approved for Staging

Approved for Live

Rejected

Archived

44.9 Knowledge Review SLAs

To prevent ingestion backlog from piling up, use practical turnaround targets.

44.10 AIM Knowledge Backlog Structure

AIM should maintain the ingestion backlog in four buckets.

Bucket A: Pilot-Critical Now

Needed before or during pilot.

Bucket B: High-Value Next

Strong value but not needed on day one.

Bucket C: Expansion Later

Useful for broader product scale after pilot stability.

Bucket D: Historical / Research

Useful for reference but not urgent to normalize.

44.11 Recommended AIM Pilot Knowledge Backlog

Bucket A: Pilot-Critical Now

Product Sampling — core definition

IT Park Sampling logic

RWA / Apartment Sampling logic

Mall Sampling logic

In-Store Sampling logic

Brand Activation — kiosk / demo logic

LED Van campaign logic

Top 5 beauty/skincare case studies

Top 5 FMCG/snack/beverage case studies

Top budget objections and responses

Top feasibility blockers by service

Founder scoring/routing signals for high-value leads

Bucket B: High-Value Next

Retail branding

Hybrid campaign solution logic

College sampling expansion

Gym / fitness outreach expansion

Menstrual hygiene campaign nuances

Pet care targeting logic

Additional case study tagging

Bucket C: Expansion Later

voice-call transcript intelligence

email thread mining

long-term win/loss patterns

advanced proposal-block recommendations

Bucket D: Historical / Research

old proposals with outdated pricing

one-off client exception SOWs

historical services no longer central to AIM

44.12 AIM First 25 Knowledge Tasks

Below is a practical starter backlog.

44.13 Founder Interview Pack for Ingestion

Use this structured format when capturing founder knowledge.

Founder Interview Questions by Service

When is this service the best fit?

When is this service a weak fit?

What are the first three questions you ask?

What information must you know before quoting?

What makes you cautious about this type of lead?

What signals tell you the lead is serious?

What common mistakes do salespeople make with this service?

What objections come up most often?

What is the best fallback or pilot option when scope is unclear?

Which case study do you usually reference and why?

Output from Each Interview

service rules

discovery questions

scoring signals

objection-response pairs

case study mapping

feasibility warnings

44.14 Sales Debrief Capture Format

Sales users should log structured insights after important calls.

Capture Fields

lead_id

service discussed

what questions worked well

where the prospect got confused

what objection came up

what information was hard to get

what the system got right

what the system got wrong

whether founder help was needed

recommendation for logic update

This is one of the best sources for real-world ingestion improvement.

44.15 Ops Debrief Capture Format

Ops should contribute not only when something fails, but as a proactive ingestion source.

Capture Fields

service / touchpoint

what feasibility assumption was unrealistic

what information sales missed

what timeline assumptions were wrong

what permission dependency was critical

what product handling concern existed

what future question should be asked earlier

44.16 Knowledge Freshness and Retirement Rules

A knowledge item should be marked “Needs Review” when:

pricing drivers change materially

permissions reality changes

a service definition changes

repeated overrides challenge the same rule

a case study becomes outdated or less relevant

A knowledge item should be archived when:

service is no longer actively sold

case study is no longer commercially useful

logic is replaced by a better version

pricing assumptions are obsolete and misleading

44.17 Knowledge Quality Scorecard

Each ingested knowledge item can be rated before publication.

Suggested Publication Rule

Only items with acceptable ratings across all core dimensions should move live.

44.18 Knowledge Ingestion Cadence Recommendation

Daily

capture new important insights from sales and ops

tag new useful source materials

Weekly

normalize priority items

review overrides and convert them into candidate logic updates

publish approved micro-updates if safe

Monthly

review service logic freshness

review question-bank effectiveness

archive stale knowledge

refresh case study relevance

44.19 Knowledge Ops Ownership Model

If AIM wants this system to stay strong, one person should effectively own knowledge operations.

Recommended Knowledge Ops Owner Responsibilities

maintain source inventory

coordinate extraction and normalization

chase reviews and approvals

ensure freshness and archive stale logic

prepare weekly knowledge update recommendations

track ingestion throughput and bottlenecks

This role can initially be handled by Product/Admin.

44.20 Recommended First Working Session Agenda

For AIM’s first hands-on knowledge ingestion workshop, run this agenda:

Session 1: Product Sampling Core (90–120 min)

define Product Sampling v1

define IT Park, RWA, Mall, In-Store variants

list quote-critical inputs by variant

list feasibility-critical inputs by variant

list top objections by variant

list strongest case studies by variant

approve draft discovery questions

Session 2: Activation + LED Van (60–90 min)

define kiosk activation logic

define product demo logic

define LED van logic

list misfit cases

approve scoring cues and escalation signals

Session 3: Industry Plays (60–90 min)

beauty/skincare

FMCG/snacks/beverages

wellness

baby care / menstrual hygiene where relevant

44.21 Recommended Next Output

The best practical next artifact after this operating model is: a Knowledge Ingestion Tracker with columns, statuses, owners, and the first AIM backlog pre-filled

That will convert this plan into an actual working tool for the team.

45. Service-by-Service Ingestion Pack

This section provides the actual ingestion packs AIM can use service by service.

Each pack is designed to help AIM move from raw founder knowledge and past documents into: - structured service records - discovery question banks - feasibility notes - objection-response pairs - case-study tags - proposal modules - scoring signals

How to Use This Section

For each service pack: 1. review the service definition internally 2. gather the recommended source materials 3. run founder / sales / ops capture session 4. normalize outputs into structured records 5. validate the pack before publishing it into the live knowledge version

Standard Pack Structure

Each service pack includes: - service purpose - what the Entity Brain must know - source materials to collect - founder capture prompts - sales capture prompts - ops capture prompts - structured entities to create - validation checklist - publication readiness checklist

45.1 Pack 1 — Product Sampling (Core)

Service Purpose

This is the parent commercial service. It defines AIM’s overall product sampling capability, where trial-based brand outreach is used to drive awareness, first use, consideration, and in some cases conversion or measurable response.

What the Entity Brain Must Know

what product sampling means in AIM’s context

what business objectives product sampling solves

which industries are best suited

which touchpoints are available under product sampling

where sampling is a weak fit

what must be known before quoting

what must be known before confirming feasibility

what proof/case studies to show by industry or touchpoint

Recommended Source Materials

AIM sampling service decks

founder explanations of sampling model

past sampling proposals and SOWs

sample budgets or cost breakups

case studies from beauty, FMCG, wellness, beverage, baby care, etc.

past client requirement notes

WhatsApp/email threads where sampling approach was explained

Founder Capture Prompts

In AIM terms, what exactly counts as product sampling and what does not?

When do you immediately know sampling is the right recommendation?

When do you avoid recommending sampling?

What are the top 5 questions you ask first?

What do you need before giving even a budgetary estimate?

Which touchpoints do you mentally shortlist first by category?

What makes a product sampling brief weak or risky?

What kind of client expectation usually creates trouble later?

Sales Capture Prompts

What type of brands ask for sampling most often?

What information do prospects most often fail to provide?

Which objections come up early most often?

What questions usually open up a better conversation?

Where do you most often need founder help today?

Ops Capture Prompts

What are the most common feasibility blockers in sampling?

Which handling or permission issues are often missed by sales?

What lead-time assumptions are most often unrealistic?

What reporting expectations should be carefully managed?

Structured Entities to Create

Product Sampling service record

parent discovery question set

universal quote-critical input set

universal feasibility-critical input set

universal sampling objections set

universal sampling scoring cues

touchpoint decision matrix

case-study map by industry and objective

Validation Checklist

service definition is clear and non-generic

best-fit industries are captured

clear misfit logic exists

all child touchpoints are referenced consistently

quote-critical inputs are complete but not excessive

feasibility notes reflect real delivery constraints

Publication Readiness Checklist

parent service record approved

universal sampling question bank approved

top 3 case studies tagged

pilot scoring cues approved

founder escalation signals approved

45.2 Pack 2 — IT Park Sampling

Service Purpose

Sampling executed in office parks, tech parks, or workplace clusters to reach working professionals and employee audiences.

What the Entity Brain Must Know

who this touchpoint is best for

when IT parks outperform malls or RWAs

premium vs volume-focused park choices

kiosk vs promoter-led distribution options

branding dependencies

employee audience fit by category

permission and access realities

Ideal Use Cases

beauty / skincare targeting working professionals

beverages and wellness products for office-going consumers

premium FMCG trial among salaried urban audience

product education in controlled weekday environments

Common Misfit Cases

products with no working-professional relevance

very low sample quantity requests where park access effort is too high

brands demanding very broad general household reach

extremely urgent campaigns with no time for park approvals/access coordination

Recommended Source Materials

past IT park proposals

lists of past venue types or corporate parks used

photos / proof of previous activations

staffing notes

permission notes and timelines

case studies with office-going TG

Founder Capture Prompts

When do you choose IT parks over malls or apartments?

What kind of products work best here?

How do you distinguish premium parks vs high-volume parks?

What does the client need to clarify before pricing is meaningful?

What usually gets underestimated in this touchpoint?

Sales Capture Prompts

What target-audience descriptions signal a strong IT park fit?

What questions help reveal whether the client wants interaction or only distribution?

What confusion do prospects typically have about office park access or quality of audience?

Ops Capture Prompts

How much lead time is typically needed?

What permissions or coordination models commonly apply?

What branding / setup limitations exist on site?

What manpower assumptions are realistic?

Structured Entities to Create

IT Park Sampling sub-service record

quote-critical question set

feasibility note set

premium-vs-volume venue assumptions guide

objections specific to workplace outreach

beauty/wellness/FMCG case-study tag group

Validation Checklist

working-professional TG logic is explicit

premium / scale differentiation is captured

permission model is described accurately

site setup options are clearly defined

Publication Readiness Checklist

one premium audience case study tagged

one volume-focused case study tagged

founder-approved must-ask questions loaded

feasibility notes validated by ops

45.3 Pack 3 — RWA / Apartment Sampling

Service Purpose

Sampling conducted in residential communities, apartment complexes, or gated societies to reach households and family decision-makers.

What the Entity Brain Must Know

which household-oriented categories fit best

how to distinguish premium apartments vs broad family communities

gate activity vs kiosk vs deeper engagement formats

society permissions reality

household decision-maker targeting logic

where residential outreach is a poor fit

Ideal Use Cases

baby care

household FMCG

family-use personal care products

food trial for family or community consumption

products where homemakers / parents / households matter

Common Misfit Cases

youth-only products with weak household relevance

categories better suited to workplace or college contexts

campaigns with no tolerance for society approvals or timing limits

premium niche categories that need a more controlled aspirational environment

Recommended Source Materials

apartment activation proposals

pricing sheets by society count or manpower model

permission notes

earlier residential campaign proofs

community-wise targeting notes if available

Founder Capture Prompts

What are the strongest buying situations for RWA sampling?

What signals tell you a client actually needs residential reach rather than mall or retail reach?

What are the first three things you ask about scale and society profile?

When do you reject or redirect the lead?

Sales Capture Prompts

What do prospects usually misunderstand about RWA execution?

What info is usually missing when they ask for pricing?

Which objections or hesitations come up most often?

Ops Capture Prompts

What permission models differ across apartments?

What timing rules or society restrictions are common?

What staffing assumptions or transport considerations matter?

Structured Entities to Create

RWA / Apartment Sampling sub-service record

society-type segmentation notes

quote-critical questions by residential model

permission dependency notes

household-relevance scoring cues

objections around permissions / community access / value perception

Validation Checklist

household TG logic is strong

premium vs broad-community distinction is captured

permission issues are realistic

scale planning logic is usable for quoting

Publication Readiness Checklist

at least 2 residential campaign examples tagged

key objections and responses approved

risk notes validated by ops

45.4 Pack 4 — Mall Sampling / Mall Activation

Service Purpose

Sampling or trial activity inside malls or public premium venues, often supported by kiosk, promoter interaction, or branded setup.

What the Entity Brain Must Know

when mall activation is worth recommending

premium-mall vs high-footfall-mall logic

kiosk vs promoter-only formats

branding/fabrication impact on cost and feasibility

demo-led vs handout-led differences

weekend vs weekday considerations

Ideal Use Cases

beauty / skincare

premium personal care

beverage, food, and new launches needing mass trial

products benefitting from visible public engagement

brands wanting premium perception plus reach

Common Misfit Cases

very low budgets for premium venues

products with no shopper interaction value

client not ready for branding/fabrication cost implications

B2B products with poor consumer venue relevance

Recommended Source Materials

mall activation proposals

fabrication cost sheets

mall permission notes

staffing models

photos and case studies

existing premium-vs-footfall venue notes

Founder Capture Prompts

When do you recommend mall before IT park or retail?

How do you distinguish premium need vs simple volume need?

What is the minimum information needed before pricing?

When do branding requirements materially change the solution?

Sales Capture Prompts

What do prospects usually ask first about malls?

What do they misunderstand about cost drivers?

Which questions help uncover whether a kiosk is really needed?

Ops Capture Prompts

What permissions, setup, or power needs matter most?

What fabrication turnarounds are realistic?

What site constraints affect demo-led activity?

Structured Entities to Create

Mall Sampling / Activation sub-service record

venue-tier logic notes

kiosk-vs-promoter scope rules

branding/fabrication cost driver notes

weekend/weekday planning assumptions

mall-specific objections and responses

Validation Checklist

venue tier logic is explicit

cost drivers are accurately captured

kiosk vs promoter-only differentiation is clear

demo/compliance concerns are noted where relevant

Publication Readiness Checklist

one premium mall case study tagged

one broad-footfall mall example tagged

fabrication notes validated by ops

45.5 Pack 5 — In-Store / Retail Sampling

Service Purpose

Sampling or product trial executed inside retail stores to influence shopper conversion, product education, and sell-out.

What the Entity Brain Must Know

when in-store is stronger than mall or residential

retailer / chain approval dependence

store count and chain specifics as cost drivers

demo / educate / distribute staffing differences

shelf / in-store conversion use case

store-level reporting expectations

Ideal Use Cases

launch support in modern trade or chain stores

sell-out push

shopper education for new or unfamiliar products

categories where point-of-purchase trial matters strongly

Common Misfit Cases

no retailer tie-up or unclear store access

no list of stores or chain context

client expects instant conversion attribution without retail control

extremely low store count with disproportionate approval effort

Recommended Source Materials

retail sampling proposals

store-level campaign reports

retailer-specific notes if available

approval dependencies

promoter training notes

case studies from retail chain activations

Founder Capture Prompts

When is in-store the right answer instead of mall or IT parks?

What do you need to know before even giving an initial estimate?

How do you judge whether the client has real retail access?

What kinds of products benefit most from in-store demo or education?

Sales Capture Prompts

What questions reveal whether retailer approval is real or assumed?

What common confusion exists between in-store branding and in-store sampling?

What are the most common client goals here: sell-out, awareness, education?

Ops Capture Prompts

What data is required from stores before execution?

What installation/demo rules matter on ground?

How do staffing/training assumptions change by category?

Structured Entities to Create

In-Store / Retail Sampling sub-service record

retailer approval logic notes

quote-critical question set by chain/store scenario

training-level / promoter-role notes

store-count pricing drivers

retail-specific objections and proof assets

Validation Checklist

store access dependency is explicit

conversion vs education objective split is clear

retailer-approval logic is realistic

staffing differences are captured

Publication Readiness Checklist

one retail-chain case study tagged

store/chain logic validated by sales and ops

must-ask questions approved

45.6 Pack 6 — Kiosk-Based Brand Activation / Product Demo Booth

Service Purpose

Interactive branded activation designed to attract attention, engage audiences, demonstrate the product, and support trial or education.

What the Entity Brain Must Know

when simple sampling should become a fuller activation

kiosk vs light branded setup vs promoter-only model

demo-led vs gamified vs engagement-led activation

branding/fabrication requirements

staff/training expectations

venue-space and power requirements

Ideal Use Cases

product launches needing interaction

categories requiring demonstration or education

premium public or retail environments

campaigns aiming for stronger recall than handout-only distribution

Common Misfit Cases

clients wanting only passive visibility with no interaction

no tolerance for fabrication or branding budget

very small-scale brief where a kiosk is overkill

categories with heavy demo/compliance restrictions not yet thought through

Recommended Source Materials

kiosk activation proposals

demo booth budgets

fabrication vendor templates

staff role descriptions

game / engagement format notes

execution photos and case studies

Founder Capture Prompts

What makes you move from sampling to activation?

What signs tell you the client needs engagement, not just distribution?

What are the most common activation formats AIM should standardize?

When does the kiosk become too heavy or unnecessary for the brief?

Sales Capture Prompts

What client words or goals signal this is really an activation brief?

What discovery questions help uncover branding or engagement expectations?

Which client misunderstandings about cost and complexity are most common?

Ops Capture Prompts

What setup requirements matter most on site?

What dependencies exist around fabrication, power, storage, transport, staff training?

What kind of lead times are realistic by venue type?

Structured Entities to Create

Kiosk Activation sub-service record

demo / gamification / education decision notes

branding/fabrication module rules

venue dependency notes

activation-specific objections and responses

proposal modules for kiosk scope variants

Validation Checklist

activation-vs-sampling distinction is clear

heavier-scope dependencies are captured

staffing and training assumptions are usable

venue dependency notes are grounded

Publication Readiness Checklist

at least 2 activation case studies tagged

fabrication module logic approved

ops risk notes reviewed

45.7 Pack 7 — LED Van / Mobile Outreach

Service Purpose

Vehicle-led mobile visibility or route-based campaign used for awareness, launch buzz, route coverage, or branch/hotspot-based exposure.

What the Entity Brain Must Know

when LED van solves the client’s objective and when it does not

route-based awareness logic

duration, city, and vehicle-type cost drivers

permissions and operating-hour realities

route planning needs

whether client wants visibility only or additional support like audio/promoter/branding

Ideal Use Cases

city-wide visibility bursts

launch buzz

route-specific awareness around branches, hotspots, events, or neighborhoods

quick reach-focused campaigns where awareness is the main job

Common Misfit Cases

clients expecting direct measurable conversion without support layers

no clarity on route, city, or duration

unrealistic immediate deployment when vehicle availability is constrained

clients needing deep interaction instead of visibility

Recommended Source Materials

LED van proposals

city-wise rate cards or budgets

route planning notes

vehicle availability notes

permission notes

photos / video proofs

Founder Capture Prompts

When do you recommend LED van over static media or on-ground activation?

What are the main commercial drivers for pricing and recommendation?

What is commonly misunderstood by clients about this format?

When should the lead be re-scoped because expectation is wrong?

Sales Capture Prompts

Which questions expose whether the client wants awareness or performance?

What do clients often fail to provide about routes, days, and city needs?

What objections usually come up around cost or utility?

Ops Capture Prompts

What availability and permission realities differ by city?

What are the standard operating assumptions around kilometers, hours, driver, fuel, tolls?

What lead-time caveats matter most?

Structured Entities to Create

LED Van / Mobile Outreach sub-service record

city / duration / route cost driver set

awareness-fit scoring cues

expectation-mismatch objection library

route planning note set

ops assumptions record by city where possible

Validation Checklist

route/visibility logic is clear

performance-vs-awareness expectation issue is captured

city-specific feasibility notes exist where possible

standard operating assumptions are explicit

Publication Readiness Checklist

at least 1 Bangalore and 1 Hyderabad example or note set if available

cost-driver structure approved

sales must-ask questions approved

45.8 Cross-Pack Standard Output Checklist

For every service pack before publication, AIM should have these minimum outputs: - 1 approved service record - 1 approved discovery question set - 1 approved quote-critical input list - 1 approved feasibility-critical input list - 1 approved risk / constraint note set - 1 approved objections-and-response set - 1 approved scoring cue set - at least 1 case study tagged, ideally 2+ - founder reviewer sign-off - ops sign-off if execution-sensitive

45.9 Cross-Pack Working Session Format

Session Format per Service

Duration: 45–75 minutes per service pack

Suggested Agenda

define the service in AIM terms

identify best-fit vs weak-fit use cases

finalize mandatory discovery questions

finalize quote-critical fields

finalize feasibility-critical fields

capture common objections

shortlist proof/case studies

note the top risk patterns

define escalation situations

approve draft structured records

45.10 Recommended Working Sequence for AIM

Use this order for the first ingestion cycle: 1. Product Sampling (Core) 2. IT Park Sampling 3. RWA / Apartment Sampling 4. Mall Sampling 5. In-Store / Retail Sampling 6. Kiosk Activation 7. LED Van / Mobile Outreach

This sequence matches the highest-value pilot logic already defined.

45.11 Recommended Next Artifact

After this service-by-service pack, the best next artifact is: a filled Knowledge Ingestion Tracker with these service packs broken into actionable rows, owners, and due dates

That will let AIM immediately begin execution service by service.

46. Filled Service-Record Pack — Product Sampling (Core)

This section provides the first fully filled service-record pack for AIM Entity Brain.

It is written in a format that can be directly used by: - Product/Admin during ingestion - founders during validation - engineering while shaping the knowledge schema - sales while understanding what the system should know

This is the parent service record for Product Sampling. Sub-services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

46.1 Service Record Header

46.2 Service Definition

Working Definition

Product Sampling is AIM’s controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

46.3 Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following: - product trial - awareness through physical experience - new product launch support - target-group-specific introduction - category education - sell-out assistance in supported environments - feedback collection after trial - trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

46.4 Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

46.5 Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

46.6 Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

46.7 Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

46.8 Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known: - product category - target audience - geography - timeline band - sample volume or scale band - preferred touchpoint or touchpoint recommendation path - campaign model (pilot / rollout) - budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

46.9 Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following: - permission dependency by chosen touchpoint - product handling requirements - temperature / tasting / demo constraints if any - timeline realism - promoter/staffing need - branding/setup scope if applicable - city-level ops availability - reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

46.10 Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by: - touchpoint type - city and geography spread - sample volume - campaign duration - promoter/manpower need - setup / kiosk / branding requirement - permissions dependency - reporting complexity - handling complexity of sample product - campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

46.11 Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

46.12 Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

46.13 Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say: - “Product Sampling is a strong parent fit.” - then recommend child path(s) with reason - then show assumptions and missing inputs before final scoping

46.14 Risk Flags

The system should explicitly warn when: - product category and venue appear mismatched - target audience is too broad for current scope - timeline may not support permissions or setup - scale is too low for chosen touchpoint economics - attribution expectations exceed planned campaign design - sample handling requirements are still unclear

46.15 Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by: - industry - objective - touchpoint - geography - audience type - scale band - reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

46.17 Validation Checklist — Filled

46.18 Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following: 1. founder review and wording approval 2. sales-head review of objections and discovery questions 3. ops validation of feasibility risks and handling constraints 4. case-study mapping for at least 3

strong parent references 5. confirmation of child-service inheritance model in knowledge schema 6. approval of parent scoring cues and escalation triggers

46.19 Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is: IT Park Sampling

Reason: - it is one of AIM's highest-value sampling variants - it frequently needs nuanced founder judgment - it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM's targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Cross-Industry Recommendation Rules + Industry-to-Service Ranking Matrix

1. Document Purpose

This document defines the cross-industry recommendation layer for AIM Entity Brain.

Its purpose is to help the system answer one of the most important commercial questions consistently:

Given the industry, objective, audience, budget, timeline, and context, which AIM service should be recommended first, which should be recommended second, and which should be avoided?

This document is meant to sit above:

individual service records

individual industry playbooks

It acts as the decision bridge between them.

2. Why This Layer Matters

If the Entity Brain only knows:

what each service is, and

what each industry generally prefers,

that is still not enough.

It must also know:

when to prioritize precision over scale

when to prioritize trust over reach

when to prioritize conversion context over visibility

when to recommend pilot-first instead of rollout-first

when one service is the primary fit and another is only a secondary option

Without this layer, the system may produce flat recommendations instead of founder-like recommendations.

3. Recommendation Design Principles

Industry fit alone is not enough. Objective and audience context must refine the choice.

Service ranking should be conditional, not absolute.

Primary recommendation should solve the main business job.

Secondary recommendation should exist only if it meaningfully improves fit.

The system should clearly separate core fit from optional expansion paths.

Misfit logic should suppress attractive-but-wrong options.

If the environment can damage brand fit, that should override scale temptation.

4. Recommendation Output Model

For any qualified lead, the system should produce:

4.1 Primary Recommendation

The best current commercial path.

4.2 Secondary Recommendation

A viable alternative if:

budget is different

timeline is different

client preference shifts

feasibility weakens for the primary path

4.3 Optional Expansion Path

Only shown when:

hybrid campaign makes sense

phased rollout is sensible

a pilot-first followed by scale path is commercially strong

4.4 Suppressed Options

The system should internally mark low-fit options as:

weak fit

avoid unless client insists

misfit

5. Cross-Industry Service Ranking Scale

Use the following recommendation strength labels.

6. AIM Service Set Used in This Matrix

The matrix uses the following service options:

IT Park Sampling

RWA / Apartment Sampling

Mall Sampling / Mall Activation

In-Store / Retail Sampling

College / Campus Sampling

Gym / Fitness Sampling

Kiosk-Based Brand Activation / Product Demo Booth

LED Van / Mobile Outreach

Hybrid Campaign Solution

7. Industry-to-Service Ranking Matrix

7.1 Beauty / Skincare

Default Recommendation Bias

prioritize audience quality over raw trial volume

suppress low-context mass distribution for premium briefs

7.2 FMCG / Snacks / Beverages

Default Recommendation Bias

prioritize usage-context fit + scalable reach

handling/logistics can promote or demote a touchpoint sharply

7.3 Wellness / Nutrition

Default Recommendation Bias

prioritize credibility of environment and affinity of audience

only scale after context fit is established

7.4 Baby Care

Default Recommendation Bias

prioritize trust-first environments over pure reach

suppress loud, generic, or low-relevance public distribution

7.5 Menstrual Hygiene

Default Recommendation Bias

prioritize comfort, relevance, and education fit over broad reach

suppress any touchpoint likely to create awkward engagement dynamics

7.6 Pet Care

Default Recommendation Bias

prioritize actual pet-owner density over general reach

avoid broad non-owner distribution

8. Cross-Industry Meta Rules

8.1 Objective-to-Service Rules

If the primary objective is Product Trial

Bias toward:

Product Sampling environments first

then activation only if explanation/experience is necessary

If the primary objective is Education

Bias toward:

Kiosk-Based Activation / Demo Booth

In-Store / Retail Sampling

guided workplace / campus / controlled environments

If the primary objective is Sell-Out Support

Bias toward:

In-Store / Retail Sampling first

then supporting awareness or trial formats second

If the primary objective is Premium Visibility + Trial

Bias toward:

Mall Sampling / Mall Activation

Kiosk-Based Activation

then IT Park if premium audience precision matters more than public visibility

If the primary objective is Awareness / Launch Buzz

Bias toward:

Mall/public visibility

LED Van / Mobile Outreach

activation formats

sampling only if trial is part of the actual objective

8.2 Audience-to-Service Rules

Working Professionals

Prefer:

IT Park Sampling

IT Park + selective premium mall hybrid

workplace-led activation

Households / Parents / Family Consumers

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

selective family-footfall mall activation

Shoppers Near Purchase Context

Prefer:

In-Store / Retail Sampling

retail + demo activation

mall only if purchase-context access is weak but trial still valuable

Students / Youth

Prefer:

College / Campus Sampling

college + activation hybrid

mall only if youth public context is more commercially relevant than campus

Fitness / Wellness Users

Prefer:

Gym / Fitness Sampling

Gym + workplace hybrid

premium mall/public demo only if visibility matters alongside trial

Premium Public Audience

Prefer:

Mall Sampling / Mall Activation

Kiosk-Based Activation

selective IT Park if public visibility is less important than audience quality

8.3 Environment-Sensitivity Rules

High Environment Sensitivity Categories

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

premium Pet Care

Rule

For these categories, environment fit should carry extra recommendation weight.

The system should demote any touchpoint that is operationally possible but brand-wise weak.

8.4 Trust-Sensitivity Rules

High Trust-Sensitivity Categories

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule

When trust sensitivity is high:

prefer controlled, relevant environments

prefer trained promoter / guided interaction where appropriate

suppress low-context scale-first paths unless the brand explicitly prefers them

8.5 Scale-First vs Precision-First Rules

Default Precision-First Industries

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

Default Scale-First Industries

FMCG / Snacks / Beverages

Rule

If a scale-first industry has specialized handling or a niche audience, temporarily treat it like a precision-first brief.

If a precision-first industry has broader mass orientation and low environment sensitivity, allow controlled scale expansion.

9. Recommendation Tie-Breaker Rules

When two services look viable, use this tie-breaker order:

Audience relevance

Environment credibility / brand fit

Objective fit

Feasibility realism

Budget alignment

Case-study support availability

Speed to deploy

Example

If both Mall Sampling and IT Park Sampling are viable for a premium skincare brand targeting women professionals:

choose IT Park first if audience precision matters more

choose Mall first if public brand visibility is equally important

10. Pilot-First Recommendation Rules

The system should recommend pilot-first when:

the client is exploring a new touchpoint

the category is premium or trust-sensitive

audience quality matters more than raw volume

the brief is strategically important but still unclear

the product has handling or explanation complexity

the client wants measurable proof before scale

Pilot-First Output Language

“A pilot-first approach may be appropriate before broader rollout.”

“We recommend validating audience response in one city / one touchpoint first.”

“This touchpoint looks promising, but a controlled phase 1 will likely improve learning and reduce waste.”

11. Hybrid Campaign Recommendation Rules

The system should recommend Hybrid Campaign Solution only when one of the following is true:

the brief genuinely spans multiple distinct audiences

the objective requires both trial and visibility

the brand wants phased testing across environments

one touchpoint solves awareness while another solves conversion/trial

Good Hybrid Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid campaigns just to sound strategic. Recommend them only when they improve commercial fit materially.

12. Suppression Rules

The system should suppress or demote services when:

audience fit is weak

the environment can damage brand perception

permissions or access make the path unrealistic for the timeline

the budget makes the recommendation commercially misleading

the service solves a secondary objective but not the primary one

the recommendation depends on assumptions not yet acceptable for proposal stage

13. Ranking Matrix by Objective Pattern

13.1 Trial at Scale

13.2 Premium Targeted Trial

13.3 Education + Trial

13.4 Sell-Out Support

13.5 Awareness / Launch Buzz

14. Recommended Engine Logic Flow

When generating recommendations, the engine should apply this sequence:

classify industry

classify probable objective

classify target audience

classify environment sensitivity

classify trust sensitivity

classify scale-first vs precision-first need

retrieve ranked service candidates for that industry

rerank candidates based on objective and audience

suppress services failing misfit rules

promote pilot-first or hybrid path if conditions are met

generate primary, secondary, and optional expansion recommendation

15. Suggested Recommendation Output JSON

16. Validation Checklist

17. Publication Readiness Checklist — Pending Actions

Before this matrix goes live, AIM should complete the following:

founder review of all primary ranking assumptions

sales-head validation using 15–20 real past leads

ops validation where service feasibility can materially rerank choices

connect each ranked service to actual service-record logic IDs

test tie-breaker behavior across ambiguous multi-service leads

define admin-editable ranking override rules where necessary

18. Recommended Immediate Next Artifact

After this cross-industry recommendation matrix, the strongest next artifact is:

Industry-to-Service Decision Tree + Scenario Test Library

Reason:

the matrix defines the rules

the next step is to test those rules on real lead scenarios

this will help AIM catch wrong defaults before the engine goes live

AIM Beauty / Skincare — Industry Playbook

1. Document Purpose

This document contains the standalone Industry Playbook for Beauty / Skincare within the AIM Entity Brain knowledge-ingestion framework.

It is designed to help AIM capture how Beauty / Skincare brands think, buy, evaluate sampling/activation channels, and what commercial logic the Entity Brain should use when qualifying or recommending solutions.

This playbook should support:

discovery quality

service recommendation quality

pitch-angle selection

objection handling

scoring accuracy

case-study matching

founder-like commercial reasoning for beauty and skincare briefs

2. Industry Definition

Working Definition

Beauty / Skincare in the AIM context includes brands and product lines focused on:

facial skincare

body care

premium skincare

derma / active skincare

personal grooming products with skincare adjacency

cosmetic-skincare crossover products

self-care products where trial, routine fit, trust, and product education matter

Industry Characteristics

This category is usually:

highly target-group sensitive

perception-sensitive

environment-sensitive

trust-sensitive

trial-friendly when the right audience and context are chosen

often premium or semi-premium in positioning

Important Commercial Truth

For Beauty / Skincare, where the trial happens matters almost as much as how the trial happens.

The wrong environment can reduce brand fit even if the execution is operationally correct.

3. What the Entity Brain Must Know

The Entity Brain should understand the following about Beauty / Skincare briefs:

premium perception matters

environment quality affects response quality

target-group precision is usually more important than raw distribution scale

guided education can matter more than simple handout for some products

female-focused or premium-working-professional segments are often key

product trial can be powerful, but only when the setting aligns with product identity and target audience

brands may care about feedback, repeat usage intent, and trial quality more than just quantity

some subcategories need sensitivity around claims, skin type relevance, and demonstration tone

4. Buyer and Stakeholder Logic

Common Buyer Personas

Brand Manager

Marketing Manager

Category Manager

Founder / Co-Founder (especially D2C)

CMO / Marketing Head

Trade Marketing Manager

Growth / Performance-marketing influenced brand teams in D2C setups

Stakeholder Concerns

Beauty / Skincare decision-makers often care about:

relevance of target audience

premium fit of touchpoint

product education quality

perception risk

brand-image consistency

measurable post-trial signals

whether the activation feels “on-brand”

whether the environment attracts the right women / professionals / shoppers

Typical Internal Decision Dynamics

brand team may want premium fit and perception

trade team may want conversion or store movement

founder may want efficient pilot validation before scale

performance/growth stakeholders may ask about attribution or measurable response

5. Typical Business Objectives

Strongest Objectives in This Industry

product trial

premium target-group introduction

launch awareness

category education

guided trial for unfamiliar formulation/product

feedback capture after first use

targeted sampling to women professionals / premium shoppers / high-affinity segments

Secondary Objectives

lead capture for remarketing

QR / coupon-linked follow-up

retail conversion support

premium brand visibility

Weak / Misaligned Objectives

broad mass distribution with no target-group logic

low-quality reach for premium skincare brief

ultra-transactional performance expectation from touchpoint with no measurement design

aggressive sell-out expectation from a brand-awareness-only activity

6. Target Audience Logic

For Beauty / Skincare, the Entity Brain should push for greater audience clarity than in many FMCG categories.

Key Audience Dimensions to Capture

women / men / unisex relevance

age band

life stage

premium vs mass orientation

working professionals vs homemakers vs students

skin concern or category relevance if applicable

urban premium vs broad-market audience

purchase behavior: exploratory, routine, premium, problem-solution driven

High-Value Audience Patterns

women professionals in urban offices

premium mall shoppers

premium apartment communities

skincare-aware D2C shopper segments

wellness-oriented premium consumers

pharmacy / modern trade beauty buyers where education matters

Lower-Quality Audience Situations

broad unfiltered general crowd for premium skincare launch

environments that do not support brand identity or product explanation

settings where the trial audience is unlikely to be the buyer

7. Service Fit Logic for Beauty / Skincare

Strongest Service Fits

IT Park Sampling

Best when:

target is women professionals or urban working consumers

brand positioning is premium or aspirational

weekday high-quality audience matters

guided product introduction can be done efficiently

Mall Sampling / Mall Activation

Best when:

premium public visibility matters

the product benefits from visible trial and brand presence

the category needs aspirational retail/public context

kiosk or guided setup improves the experience

In-Store / Retail Sampling

Best when:

product education at point of purchase matters

retail conversion support is important

the brand is present in relevant modern trade or beauty retail environments

shopper hesitation can be reduced by in-store demo or explanation

Kiosk-Based Brand Activation / Demo Booth

Best when:

category education matters

the brand wants visual presence plus guided experience

the product requires more explanation than a simple sample handout

RWA / Apartment Sampling

Best when:

the product is highly relevant to women / families in premium communities

the objective is household-level trust and targeted community introduction

community context is a better fit than public venue

Moderate Service Fits

gym / studio outreach for skincare-wellness crossover or premium self-care angle

hybrid campaigns combining IT park + mall or mall + retail for layered objective

Weak / Misfit Service Fits

low-context mass distribution for premium skincare

youth-heavy campus-first campaigns unless the product truly fits that audience and brand tone

visibility-only mobile outreach unless part of a broader launch layer

8. Premium-Fit vs Mass-Fit Logic

Beauty / Skincare often requires the brain to reason about quality of audience and environment, not just volume.

Premium-Fit Signals

premium or semi-premium price point

founder/brand team emphasizes brand perception

product has routine or care-value rather than impulse-only nature

explanation, guided trial, or aspirational association matters

target audience is urban professional or premium shopper segment

Mass-Fit Signals

accessible price point with broad consumer relevance

trial at scale matters more than premium setting

product is simple enough for broader distribution environments

awareness is more important than elevated perception

Rule

If the brand is premium or skincare-education-led, the system should usually prefer audience-quality-first recommendations over mass-volume-first recommendations.

9. Discovery Question Bank — Beauty / Skincare Specific

These questions should be layered on top of service-specific discovery.

10. Quote-Critical Inputs for Beauty / Skincare

Before giving strong commercial direction in this industry, the system should try to know:

product category / SKU type

premium vs mass orientation

target user segment

environment preference or sensitivity

objective (trial / launch / education / retail support)

city or cities

scale or sample volume

engagement depth needed

budget band or budget openness

Minimum for Strong Recommendation

target user clear

product positioning clear

objective clear

city clear

probable touchpoint fit clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

engagement depth roughly known

environment quality preference roughly known

11. Feasibility / Delivery Considerations

Beauty / Skincare campaigns can fail commercially even when they are operationally completed. The brain should therefore treat brand-fit feasibility as well as execution feasibility seriously.

Important Feasibility Considerations

promoter grooming and product understanding

product explanation requirements

trial format suitability in venue

hygiene / handling requirements where applicable

whether demo/application context is simple or sensitive

premium-environment expectations vs actual execution scope

reporting expectations after trial

Brand-Fit Risks

cheap-feeling execution for premium product

wrong audience environment for brand tone

promoter interaction quality too weak for category depth

trial happening in a context that reduces perceived trust or desirability

12. Typical Objections and Response Directions

Response Principles

speak the language of audience quality, not just activity quantity

protect brand-image fit in every recommendation

do not sell scale-first if the brand is asking for premium relevance

use pilot framing when the brand is uncertain about touchpoint performance

13. Scoring Cues — Beauty / Skincare

Positive Signals

clear target user segment

premium-fit or audience-fit environment matters to the brand

product benefits from trial or education

brand is open to pilot-first validation

objective and segment are well articulated

the recommended touchpoint matches both audience and brand tone

Negative Signals

brand is premium but asks for low-quality mass distribution environment

no clarity on user segment

category education need is high but engagement budget is absent

expectation of strong conversion with no measurement design

touchpoint choice conflicts with brand positioning

Strategic Signals

high-credibility brand or D2C growth brand

strong case-study value in beauty/skincare vertical

potential for repeat use across launches / SKUs / regions

14. Recommendation Logic

When the lead is Beauty / Skincare, the system should prioritize recommendations using this order:

target user fit

brand-image / environment fit

objective fit

trial depth or education need

budget and feasibility

Typical Recommendation Patterns

Pattern A: Premium women professionals

IT Park Sampling

premium mall activation

pilot-first recommendation

Pattern B: Premium shopper/public visibility

Mall Sampling / Kiosk Activation

guided trial / demo support

Pattern C: Retail conversion support

In-Store / Retail Sampling

demo-led or education-led promoter support

Pattern D: Premium family / residential relevance

selective premium apartment / community sampling

Recommendation Output Style

The system should say things like:

“Because this is a premium skincare product targeting women professionals, a high-quality audience environment is likely more valuable than broad distribution volume.”

“A pilot across IT parks or premium mall environments may help validate trial quality before scale.”

“If product education is important, a kiosk/demo-led setup may perform better than handout-only distribution.”

15. Risk Flags

The system should explicitly warn when:

premium brand fit is being diluted by the recommended environment

audience precision is weak

product education need is high but execution is too light

the brief mixes performance expectations with awareness-only design

environment quality and brand expectations are misaligned

promoter/training requirements are underestimated

16. Case Study Tagging Guidance

Beauty / Skincare case studies should be tagged by:

premium vs mass orientation

women professionals / shoppers / families / youth audience

city

touchpoint

execution depth (handout / guided trial / demo / kiosk)

objective (trial / education / launch / retail support)

reporting depth

brand-positioning tone

Priority Case Study Buckets Needed First

premium skincare IT park sampling

beauty mall activation / kiosk example

skincare in-store retail education example

premium community sampling example

launch-stage trial + feedback example

17. Suggested JSON Shape

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Beauty / Skincare playbook goes live, AIM should complete the following:

founder review and wording approval

sales-head review of discovery prompts and objection handling

mapping of at least 3–5 relevant beauty/skincare case studies

validation of premium-vs-mass recommendation logic against real proposal history

refinement of buyer-persona notes based on AIM’s actual client mix

confirmation of service-ranking logic across IT parks, malls, retail, and premium communities

20. Recommended Immediate Next Playbook

After this Beauty / Skincare industry playbook, the next best playbook to fill is:

FMCG / Snacks / Beverages

Reason:

it is high-volume and commercially important for AIM

it contrasts sharply with Beauty / Skincare in scale logic and environment sensitivity

it will help the Entity Brain learn when to prioritize mass-trial logic versus premium-fit logic

AIM Industry-to-Service Decision Tree + Scenario Test Library

1. Document Purpose

This document converts AIM’s cross-industry recommendation logic into:

practical decision trees

scenario-based recommendation tests

expected outputs for evaluation

failure patterns to watch before go-live

It is designed to help AIM validate whether the Entity Brain can make founder-like decisions under realistic lead conditions.

This document should be used by:

founders

sales head

product/admin

engineering

QA/evaluation team

2. Why This Document Matters

The ranking matrix tells the system what is generally stronger.

But in real life, leads are messy.

A good engine must handle:

incomplete information

competing objectives

mixed audiences

budget/timeline tension

touchpoint bias from clients

category sensitivity

So this document exists to answer:

When a real lead appears, what path should the system follow, and what output should it generate?

3. Decision Tree Design Principles

Start with the business job, not the touchpoint the client casually mentions.

Check audience fit before cost optimization.

For sensitive or premium categories, environment quality can outrank raw scale.

If feasibility is weak, recommendation strength must drop even when fit looks good.

If multiple services are viable, choose the one that best solves the primary objective.

Use pilot-first when ambiguity is commercially meaningful.

Suppress attractive but misleading options.

4. Master Decision Flow

The engine should evaluate in this order:

identify industry

identify primary objective

identify target audience

identify trust / environment sensitivity

identify scale-first vs precision-first need

identify purchase-context need vs awareness-only need

identify handling / compliance / execution complexity

identify budget and timeline realism

identify whether one service clearly dominates or hybrid is justified

generate primary, secondary, optional expansion, and suppressed options

5. Core Decision Trees

5.1 Decision Tree A — Product Sampling vs Activation vs Mobile Visibility

Step 1

If the client’s primary job is trial, go to Sampling path.

Step 2

If the client’s primary job is education + trial + visible interaction, go to Activation path.

Step 3

If the client’s primary job is awareness / launch buzz / route visibility, go to Mobile Visibility path.

Rule

Do not recommend LED Van / Mobile Outreach as the primary solution when the client actually needs product trial or guided education.

5.2 Decision Tree B — Choosing the Right Sampling Environment

If target audience = working professionals

Prefer:

IT Park Sampling

premium mall only if public visibility matters too

workplace + premium hybrid if justified

If target audience = households / parents / families

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

mall/family-footfall only when public visibility is also useful

If target audience = shoppers close to purchase

Prefer:

In-Store / Retail Sampling

retail + activation hybrid

mall only if purchase-context route is weak but trial still valuable

If target audience = students / youth

Prefer:

College / Campus Sampling

youth-heavy activation

mall only if public youth relevance is stronger than campus access

If target audience = fitness / performance users

Prefer:

Gym / Fitness Sampling

gym + workplace hybrid

premium public setup only if visibility matters too

5.3 Decision Tree C — Trust-Sensitive Category Rule

Applies to

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule Path

If category is trust-sensitive:

evaluate whether environment feels credible and relevant

demote touchpoints that are operationally possible but contextually weak

prefer guided interaction when education matters

prefer pilot-first if audience/context performance is uncertain

Example

If Baby Care brief asks for broad public mall handout at scale:

do not reject immediately

but demote mall as primary unless family-footfall relevance is very strong and tone can remain controlled

promote residential or family retail alternatives first

5.4 Decision Tree D — Scale-First vs Precision-First

If category is FMCG / Snacks / Beverages

Ask:

is usage relevance broad?

is trial scale important?

are handling requirements manageable?

If yes:

recommend scale-capable environments first

If category is Beauty / Skincare, Wellness, Baby Care, Menstrual Hygiene, Pet Care

Ask:

does audience quality matter more than quantity?

does trust or education matter?

can the environment affect perception?

If yes:

recommend precision / quality-first environments first

5.5 Decision Tree E — Retail Conversion Need

If primary objective includes any of the following:

sell-out support

shopper education near purchase

store movement

pharmacy / retail conversion

Then:

promote In-Store / Retail Sampling to primary or near-primary rank

use mall / public trial only as a support layer if helpful

use awareness-led formats only as secondary support

Rule

Do not let “visibility” overpower “purchase-context need” when the client’s stated goal is sell-out or conversion support.

5.6 Decision Tree F — Pilot-First Trigger

Recommend pilot-first when any of these are true:

category is premium or trust-sensitive

the client is testing a new touchpoint

the environment fit is plausible but unproven

the product has handling or training complexity

the client wants proof before scale

multiple services look viable but not conclusively so

Output Pattern

primary recommendation

clear “pilot-first” label

phase 2 expansion path if pilot succeeds

5.7 Decision Tree G — Hybrid Recommendation Trigger

Recommend hybrid only when:

the brief includes two distinct audience clusters

the brief needs both trial and visibility

a single touchpoint solves only part of the job

the brand wants phase-wise validation across environments

Good Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid by default when one service clearly solves the main objective well enough.

6. Scenario Test Library Structure

Each scenario includes:

lead brief

industry

objective

audience

known facts

unknowns

expected primary recommendation

expected secondary recommendation

expected suppression logic

whether pilot-first should trigger

why this case matters

7. Scenario Test Library

7.1 Scenario 1 — Premium Skincare Launch for Women Professionals

Lead Brief

A premium skincare brand wants to launch a serum in Bangalore and is targeting women professionals aged 24–35. They are considering sampling, want quality audience more than mass distribution, and have moderate budget.

Classified Inputs

Industry: Beauty / Skincare

Objective: Product Trial + Premium Introduction

Audience: Women Professionals

Geography: Bangalore

Budget: moderate

Timeline: within 30 days

Expected Output

Primary: IT Park Sampling

Secondary: Mall Sampling / Mall Activation

Optional Expansion: IT Park + premium mall hybrid

Suppress: LED Van as primary

Pilot-First: Yes

Why

Audience precision is stronger than public visibility as the primary job.

7.2 Scenario 2 — Snack Brand Wants High-Volume Trial in Bangalore

Lead Brief

A snack brand wants 25,000 sample trials in Bangalore over 2 weeks. They are open to colleges, IT parks, and malls. Product is simple to distribute and there are no heavy handling constraints.

Classified Inputs

Industry: FMCG / Snacks / Beverages

Objective: Mass Trial

Audience: broad youth + office-goers

Geography: Bangalore

Budget: reasonable

Handling: simple

Expected Output

Primary: Hybrid Campaign Solution

Secondary: IT Park Sampling or College Sampling depending city mix

Optional Expansion: Mall sampling for public visibility layer

Suppress: premium-only narrow channels as sole recommendation

Pilot-First: No, unless budget/timeline uncertainty exists

Why

This is a scale-first, usage-friendly product with multiple viable high-volume environments.

7.3 Scenario 3 — Protein Beverage for Fitness Audience

Lead Brief

A wellness brand wants to push a protein hydration drink among active gym-goers in Bangalore and Hyderabad. The team wants the right users, not random scale.

Classified Inputs

Industry: Wellness / Nutrition

Objective: Trial + Affinity Audience Introduction

Audience: Fitness Users

Geography: Bangalore, Hyderabad

Priority: affinity-first

Expected Output

Primary: Gym / Fitness Sampling

Secondary: IT Park Sampling if office-going wellness crossover exists

Optional Expansion: gym + workplace hybrid

Suppress: random mall/public trial as primary

Pilot-First: Yes

Why

Credibility of context matters. Fitness relevance outranks generic high-footfall reach.

7.4 Scenario 4 — Baby Care Product for Young Parents

Lead Brief

A premium baby-care brand wants to introduce a new lotion to parents of infants and toddlers in Bangalore. They care about trust and relevance more than mass reach.

Classified Inputs

Industry: Baby Care

Objective: Trust-Building Trial

Audience: Parents of infants and toddlers

Geography: Bangalore

Priority: trust-first

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling

Optional Expansion: premium communities + retail hybrid

Suppress: college, gym, LED van as primary

Pilot-First: Yes

Why

Trust-relevant family environment should dominate the recommendation.

7.5 Scenario 5 — Menstrual Hygiene Campaign for College Students

Lead Brief

A menstrual hygiene brand wants to build awareness and trial among college-age women in Chennai and Bangalore. Education is as important as product introduction.

Classified Inputs

Industry: Menstrual Hygiene

Objective: Education + Trial

Audience: College students

Geography: Chennai, Bangalore

Tone sensitivity: high

Expected Output

Primary: College / Campus Sampling

Secondary: Kiosk-Based Education / Activation Booth

Optional Expansion: college + workplace phase 2 if brand expands audience

Suppress: LED Van as primary, generic mass public handout

Pilot-First: Yes

Why

Education and comfort fit matter more than raw broad reach.

7.6 Scenario 6 — Pet Food Trial for Premium Pet Parents

Lead Brief

A pet-food brand wants to reach dog owners in premium apartment communities in Bangalore. They do not want broad household waste.

Classified Inputs

Industry: Pet Care

Objective: Targeted Trial

Audience: Dog owners in premium communities

Geography: Bangalore

Priority: owner relevance

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling in pet retail environments

Optional Expansion: premium community + pet retail hybrid

Suppress: mall/public mass distribution as primary

Pilot-First: Yes

Why

Pet-owner density and audience precision are critical.

7.7 Scenario 7 — Beverage Launch Wants Buzz, Not Sampling

Lead Brief

A beverage brand wants city-wide launch buzz for 5 days in Bangalore and Hyderabad. They want strong visibility fast and are not focused on trial in phase 1.

Classified Inputs

Industry: FMCG / Beverages

Objective: Awareness / Launch Buzz

Audience: broad public

Geography: Bangalore, Hyderabad

Speed: high

Expected Output

Primary: LED Van / Mobile Outreach

Secondary: Mall Activation if public visibility and physical brand presence are also needed

Optional Expansion: mobile outreach + selective sampling in phase 2

Suppress: product sampling as sole phase-1 recommendation if trial is not the current job

Pilot-First: Not necessary unless city/route ambiguity is high

Why

The core job is visibility, not trial.

7.8 Scenario 8 — Skincare Brand Wants Retail Sell-Out Support

Lead Brief

A skincare brand is already in a retail chain and wants stronger trial and shopper education to improve sell-out in 20 stores.

Classified Inputs

Industry: Beauty / Skincare

Objective: Sell-Out Support

Audience: Retail shoppers near purchase

Geography: Bangalore

Retail context: strong

Expected Output

Primary: In-Store / Retail Sampling

Secondary: Kiosk-Based Demo support where useful

Optional Expansion: retail + selective mall awareness if needed later

Suppress: IT Park as primary unless secondary objective emerges

Pilot-First: Yes if store behavior is untested

Why

Purchase-context need outranks premium audience experimentation.

7.9 Scenario 9 — Ambiguous Marquee FMCG Brief

Lead Brief

A well-known FMCG brand says, “We want something impactful pan-India,” but shares no real audience, no budget, and no clear objective.

Classified Inputs

Industry: FMCG

Objective: unclear

Audience: unclear

Budget: unknown

Strategic value: high

Expected Output

Primary: No strong service recommendation yet

Secondary: none until discovery improves

Optional Expansion: not applicable yet

Suppress: premature multi-touchpoint grand solution

Pilot-First: not yet; first recommend structured discovery

Escalation: Yes, high-value but low-confidence

Why

The system must resist looking smart by inventing a solution too early.

7.10 Scenario 10 — Budget-Misaligned Premium Mall Request

Lead Brief

A new brand asks for a premium multi-city mall activation but indicates a very low budget and wants immediate execution.

Classified Inputs

Industry: unknown consumer brand

Objective: visibility + trial perhaps

Budget: weak

Timeline: aggressive

Requested touchpoint: premium mall

Expected Output

Primary: Re-scope / clarify, not direct mall confirmation

Secondary: lighter public trial or pilot recommendation if relevant

Suppress: premium mall rollout as-is

Pilot-First: Yes if the client shows flexibility

Escalation: only if strategic value is high

Why

The system must protect against unrealistic client-led touchpoint bias.

8. Negative Test Cases

These are scenarios where the system should fail safely rather than force a recommendation.

8.1 Negative Case — Too Little Information

Expected behavior:

ask next-best question

do not recommend a service confidently

do not mark proposal-ready

8.2 Negative Case — High Budget but Wrong Audience Context

Expected behavior:

demote attractive but brand-weak environments

explain why a more relevant environment is stronger

8.3 Negative Case — Client Insists on Misfit Touchpoint

Expected behavior:

acknowledge the requested touchpoint

explain limitations

suggest better alternative

do not blindly confirm requested service as primary

8.4 Negative Case — High Strategic Brand, Low Confidence

Expected behavior:

escalate

avoid overcommitting

produce structured missing-information summary

9. Scenario Evaluation Rubric

Use this rubric to judge whether the engine behaves correctly.

Suggested Pass Standard

A scenario should pass only if the system gets the primary path, suppression logic, and reasoning explanation broadly right.

10. Expected Failure Patterns to Watch

During testing, watch for these recurring failures:

recommending the client’s mentioned touchpoint too early

overvaluing scale in trust-sensitive categories

overvaluing premium environments for broad FMCG needs

recommending hybrid campaigns too often

recommending LED/mobile formats when the true job is trial or education

weak suppression of misfit services

false proposal-readiness despite major unknowns

11. Suggested Testing Cadence

Round 1: Founder Calibration

run 10 scenarios manually with founder review

compare system recommendation vs founder recommendation

Round 2: Sales Calibration

run 10–15 real historical leads

compare recommendation usefulness for sales users

Round 3: Ops Calibration

test feasibility-sensitive scenarios

check whether the system under-warns or over-warns

Round 4: Pilot Live Monitoring

log real-world scenarios where recommendation changed after human review

turn those into new test cases

12. Suggested Scenario JSON Format

{
"scenario_id": "SCN-001",
"industry": "Beauty / Skincare",
"objective": "Product Trial",
"target_audience": "Women Professionals",
"geography": ["Bangalore"],
"known_facts": [
"premium product",
"moderate budget",
"working women"
],
"expected_primary_recommendation": "IT Park Sampling",

"expected_secondary_recommendation": "Mall Sampling / Mall Activation",

"expected_suppressed_services": [

"LED Van / Mobile Outreach"

],

"pilot_first_expected": true

}

13. Validation Checklist

14. Publication Readiness Checklist — Pending Actions

Before this decision-tree and scenario library goes live, AIM should complete the following:

founder review of all major scenario expectations

sales-head review of recommendation usefulness across real examples

ops review for feasibility-sensitive cases

addition of 15–20 real AIM historical lead scenarios

mapping of each scenario to service-record and industry-playbook IDs

creation of pass/fail evaluation sheet for QA and pilot reviews

15. Recommended Immediate Next Artifact

After this decision-tree and scenario test library, the next strongest artifact is:

Founder Calibration Workbook + Historical Lead Test Set

Reason:

the rules are now defined

the next step is to validate them against AIM’s actual founder judgment and past leads

this is the fastest way to catch wrong defaults before build hardening

AIM Product Sampling (Core) — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for Product Sampling (Core) from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas so that:

the main document remains lighter and safer to manage

the Product Sampling pack can be reviewed, validated, and iterated independently

AIM can use this as the working parent service record for ingestion

This is the parent service record for Product Sampling. Child services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

2. Service Record Header

3. Service Definition

Working Definition

Product Sampling is AIM’s controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

4. Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following:

product trial

awareness through physical experience

new product launch support

target-group-specific introduction

category education

sell-out assistance in supported environments

feedback collection after trial

trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

5. Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

6. Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

7. Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

8. Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

9. Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known:

product category

target audience

geography

timeline band

sample volume or scale band

preferred touchpoint or touchpoint recommendation path

campaign model (pilot / rollout)

budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

10. Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following:

permission dependency by chosen touchpoint

product handling requirements

temperature / tasting / demo constraints if any

timeline realism

promoter/staffing need

branding/setup scope if applicable

city-level ops availability

reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

11. Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by:

touchpoint type

city and geography spread

sample volume

campaign duration

promoter/manpower need

setup / kiosk / branding requirement

permissions dependency

reporting complexity

handling complexity of sample product

campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

12. Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

13. Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

14. Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say:

“Product Sampling is a strong parent fit.”

then recommend child path(s) with reason

then show assumptions and missing inputs before final scoping

15. Risk Flags

The system should explicitly warn when:

product category and venue appear mismatched

target audience is too broad for current scope

timeline may not support permissions or setup

scale is too low for chosen touchpoint economics

attribution expectations exceed planned campaign design

sample handling requirements are still unclear

16. Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by:

industry

objective

touchpoint

geography

audience type

scale band

reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

17. Service Record JSON Shape (Suggested)

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of objections and discovery questions

ops validation of feasibility risks and handling constraints

case-study mapping for at least 3 strong parent references

confirmation of child-service inheritance model in knowledge schema

approval of parent scoring cues and escalation triggers

20. Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is:

IT Park Sampling

Reason:

it is one of AIM’s highest-value sampling variants

it frequently needs nuanced founder judgment

it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM’s targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

19. Suggested JSON Shape

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Entity Brain — Product Requirements Document (PRD)

1. Document Summary

Product Name: AIM Entity Brain

Prepared For: AIM Leadership, Sales, Ops, Product, Engineering

Primary Goal: Convert founder-level commercial knowledge into a structured, scalable intelligence system that can qualify leads, guide discovery, recommend solutions, score opportunities, and sync clean intelligence into CRM.

2. Problem Statement

AIM’s best commercial judgment currently lives in the founders’ heads.

This creates recurring gaps: - Sales team depends too heavily on founders for requirement understanding and solution mapping. - Leads often come in with incomplete information, making proposal creation difficult or slow. - Discovery quality varies by salesperson. - Follow-up questions are sometimes repetitive, irrelevant, or not commercially useful. - CRM records are incomplete and inconsistent. - High-intent leads are not always identified early enough. - AI automation for chat or calling cannot work well without a strong company intelligence layer.

The business needs a system that can think more like a founder during lead intake and discovery.

3. Product Vision

AIM Entity Brain will be the company’s commercial reasoning layer.

It will: - understand services, sub-services, industries, deliverables, timelines, pricing logic, constraints, and case studies - ask the right next question based on context - avoid repetitive or low-value questioning - map lead requirements to solution pathways - score leads using AIM-specific commercial logic - assign the right salesperson or escalate for founder review - generate structured summaries and CRM-ready data - continuously improve from win/loss and human override feedback

This is not just a chatbot. It is a decision engine with memory, workflow, and learning.

4. Product Objectives

Primary Objectives

Improve discovery quality across all inbound leads.

Reduce founder dependency during lead qualification and solutioning.

Increase speed from inquiry to proposal readiness.

Improve CRM data quality and structured lead intelligence.

Create a reusable intelligence layer for sales copilot, chatbot, and AI telecalling.

Secondary Objectives

Improve lead routing and prioritization.

Reduce wasted effort on low-fit leads.

Standardize early-stage requirement gathering.

Improve consistency of proposal inputs.

Build long-term institutional memory.

5. Users

Primary Users

Sales Executives

Senior Sales Team

Sales Head

Founders

Business Development Team

Secondary Users

Operations team

Proposal team

CRM admins

Product and engineering team

External Users (Later Phase)

Website visitors

WhatsApp inquiry prospects

Outbound call recipients

6. User Problems to Solve

Sales Team Problems

“I do not know what to ask next.”

“I do not know if I have enough information to quote.”

“I do not know which service combination to pitch.”

“I need founder support for every nuanced inquiry.”

Founder Problems

“Sales keeps asking the same kind of questions.”

“Leads reach me with incomplete briefs.”

“Proposals are delayed because discovery was weak.”

“Commercial thinking is not standardized.”

Operations Problems

“Sales overpromises without checking feasibility.”

“Requirements are incomplete or vague during handoff.”

CRM Problems

“Lead records are incomplete.”

“Important commercial fields are unstructured.”

“Scoring and routing are inconsistent.”

7. Scope Definition

In Scope (Phase 1–3)

Service intelligence

Industry intelligence

Discovery question engine

Lead scoring engine

Solution recommendation engine

CRM field mapping

Internal sales copilot

External discovery chatbot

Case study retrieval

Proposal readiness assessment

Human override and feedback capture

Out of Scope (Initial Phase)

Fully autonomous proposal generation with final pricing approval

Fully autonomous discounting

End-to-end unattended telecalling at scale

Contract drafting automation

Final execution planning without human review

8. Core Product Principles

Ask only what changes the commercial decision.

Do not repeat what is already known.

Separate confirmed facts from inferred facts.

Do not promise beyond approved service logic.

When confidence is low, escalate to human review.

Every interaction should improve future intelligence.

9. Product Modules

9.1 Service Intelligence Engine

This module stores AIM’s service structure.

It should know: - service categories - sub-services - fit conditions - misfit conditions - ideal industries - ideal use cases - pricing bands - typical lead time - deliverables - exclusions - dependencies - risks - add-ons - reporting capabilities

Example Output

For a product sampling inquiry, the module should identify whether the use case is better suited for: - IT park sampling - mall activation - RWA sampling - in-store retail sampling - gym activation - quick commerce integration - multi-touchpoint pilot

9.2 Industry Intelligence Engine

This module stores how industries behave commercially.

It should know: - industry goals - buyer personas - decision cycles - budget behavior - common objections - relevant pitch angles - preferred channels/touchpoints - compliance or sensitivity issues - seasonality

Example

Skincare launches may require: - women-focused TG segmentation - premium environment fit - trial plus feedback mechanism - attribution discussion if D2C or marketplace-linked

9.3 Discovery Engine

This is the questioning brain.

It should: - identify critical missing information - select the next-best question - avoid duplicate questions - skip irrelevant questions - understand when enough information exists for the next stage - classify answers into structured CRM fields

Discovery Logic Rules

Each question should be tagged by: - service relevance - industry relevance - commercial purpose - mandatory for quote? - mandatory for feasibility? - mandatory for scoring? - ask-if conditions - skip-if conditions

Output Types

confirmed field update

inferred field update

missing information list

next-best question

9.4 Solution Mapper

This module translates discovery into recommended commercial solutions.

It should answer: - what service or sub-service fits best? - what touchpoint mix is appropriate? - should we propose pilot or full rollout? - what budget band is likely? - what timeline is realistic? - which case studies are relevant? - what risks should be flagged?

Example

If the lead is a beauty brand targeting working women in Bangalore with moderate budget and short timeline, the system may recommend: - IT parks + premium malls as primary mix - phase 1 pilot before scale - feedback capture + QR-based redemption - case studies from beauty/personal care category

9.5 FitScore Engine

This module calculates opportunity quality.

Score Components

Fit Score — 25

Authority Score — 15

Urgency Score — 15

Budget Score — 15

Completeness Score — 10

Strategic Value Score — 10

Feasibility Score — 10

Score Output Bands

80–100: High-priority qualified lead

60–79: Good lead, standard follow-up

40–59: Needs more information or nurture

Below 40: Low-fit or low-priority lead

Uses of Score

routing

SLA priority

founder escalation

proposal urgency

nurture vs immediate pursuit

9.6 Proposal Readiness Engine

This module checks whether enough information exists to move to proposal.

It should determine:

ready for capability deck only

ready for budgetary estimate

ready for scoped proposal

not ready; more discovery needed

It should also generate:

discovery summary

missing commercial inputs

suggested proposal modules

suggested case studies

suggested next action

9.7 CRM Intelligence Sync

This module converts conversation into structured CRM records.

It should update:

lead basic profile

service and sub-service

industry

objective

budget band

timeline

authority level

target audience

geography

completeness score

total lead score

recommended owner

recommended next step

missing information

It should also trigger:

task creation

SLA tagging

owner assignment

escalation to sales head/founder if required

9.8 Sales Copilot

This is the first interface to launch.

Primary Capabilities

show current lead understanding

show missing fields

suggest next questions during live call/chat

recommend service path

show lead score

show risks and assumptions

suggest case studies and pitch angle

indicate proposal readiness

Success Outcome

A salesperson should be able to handle a nuanced discovery conversation with much less founder intervention.

9.9 Discovery Chatbot

This is the second interface to launch.

Channels

website

WhatsApp

chat widget

Primary Capabilities

welcome and classify inquiry

ask context-aware questions

avoid repetitive questions

gather structured requirement data

create CRM lead

summarize requirements before handoff

hand over to human with clean context

Design Principle

The experience should feel like a smart pre-consultation, not a long lead form.

9.10 Voice Prospecting Engine (Later Phase)

This is the third interface to launch.

Uses

cold outreach

qualification calls

callback handling

early intent screening

It should use the same brain for:

pitch selection

objection handling

qualification logic

next-step routing

Strong Controls Needed

human escalation rules

no unsupported claims

no unapproved commercial commitments

call review and audit trail

10. Core Data Model

Key Objects

Service Master

Sub-Service Master

Industry Playbook

Discovery Question Bank

Solution Rules

Lead Profile

Lead Answers

Case Study Library

Objection Library

Proposal Modules

Feedback Events

Version Log

Field Status Types

Each commercially important field should have a status: - Confirmed - Inferred - Missing - Not Applicable

This is important so the system never confuses assumptions with actual customer-provided facts.

11. CRM Field Definitions

Lead Identity

company_name

contact_name

designation

phone

email

source_channel

inbound_or_outbound

Classification Fields

industry

company_size_band

service_category

sub_service_category

geography

Requirement Fields

campaign_objective

target_audience

target_geography

campaign_timeline

estimated_volume

budget_indicated

budget_inferred

reporting_expectation

attribution_expectation

approval_stage

Intelligence Fields

requirement_completeness_score

fit_score

authority_score

urgency_score

budget_score

feasibility_score

strategic_value_score

total_lead_score

confidence_score

Routing Fields

assigned_owner

founder_review_flag

escalation_flag

proposal_readiness_status

recommended_next_step

SLA_priority

Output Fields

discovery_summary

missing_information

suggested_case_studies

pitch_angle

risk_flags

assumptions

12. Key User Flows

12.1 Inbound Lead via Website / WhatsApp

User starts inquiry.

System classifies probable service and industry.

Relevant discovery logic loads.

Bot asks next-best question.

Structured fields are populated.

Lead score updates in real time.

Proposal readiness is evaluated.

CRM record is created/updated.

Salesperson is assigned.

Discovery summary is pushed to assigned owner.

12.2 Salesperson-Assisted Discovery

Salesperson opens lead.

Copilot shows known data and missing commercial fields.

Copilot suggests next-best questions.

Salesperson captures answers.

Engine updates score and recommendations.

Proposal readiness is checked.

Next action is recommended.

12.3 Founder Review Escalation

Lead has high strategic value or low confidence.

System flags for founder review.

Founder sees summarized context, missing information, and system recommendation.

Founder accepts, edits, or overrides.

Override is stored as learning input.

13. Screens / Interface Requirements

13.1 Lead Intelligence Dashboard

Must show: - lead overview - service classification - key requirement fields - score breakdown - confidence level - missing information - suggested next questions - recommended owner - proposal readiness

13.2 Discovery Panel

Must show: - live transcript or answer stream - questions already asked - fields already collected - next-best question suggestions - skipped questions and reason

13.3 Solution Recommendation Panel

Must show: - recommended service mix - why it is recommended - alternative options - likely budget band - timeline band - case studies - risks

13.4 Founder Review Panel

Must show: - summary - score - assumptions - missing information - escalation reason - approve / modify / override actions

13.5 Admin Knowledge Management Panel

Must allow: - add/edit services - add/edit question bank - update scoring logic - tag case studies - version control - activate/deactivate outdated logic

14. Functional Requirements

Must Have

structured service and industry knowledge storage

context-aware questioning

field-level state tracking

CRM field mapping

lead scoring

assignment logic

proposal readiness detection

human override capture

case study retrieval

audit logs

Should Have

objection handling suggestions

pitch-angle recommendation

email/WhatsApp summary generation

founder override analytics

win/loss learning dashboards

Later

AI voice calling

automated meeting scheduling

auto-generated tailored proposal drafts

predictive win probability

15. Non-Functional Requirements

fast enough for live salesperson use during calls

support multi-turn stateful conversations

secure access control by role

full auditability of question/answer flow

version control for service logic

scalable across multiple services and future brands

reliable CRM sync

fallback behavior if model confidence is low

16. Guardrails and Governance

Commercial Guardrails

no final price commitment without approved logic

no unsupported delivery promise

no unauthorized discounts

no invented case studies or results

Reasoning Guardrails

always distinguish confirmed vs inferred data

ask only relevant questions

never repeat confirmed questions

stop when enough information is available

escalate when confidence falls below threshold

Operational Guardrails

all high-value leads with low confidence require review

all overrides should be logged

all service definitions and question logic must be versioned

17. Analytics and Success Metrics

Sales Productivity Metrics

founder interruptions per lead

average discovery completeness score

average time to proposal readiness

average time from inquiry to first qualified summary

Lead Quality Metrics

qualified lead rate

high-score lead conversion rate

disqualification accuracy

proposal-to-win ratio

Bot Quality Metrics

duplicate question rate

irrelevant question rate

missing-field rate after discovery

confidence/escalation rate

structured field accuracy

Learning Metrics

number of founder overrides

override categories

recommendation accuracy over time

score accuracy vs actual sales outcomes

18. Phased Rollout Plan

Phase 1 — Knowledge and Logic Foundation

Deliverables

service taxonomy

sub-service taxonomy

industry playbooks

discovery question bank

lead scoring model

CRM field map

case study library tagging

founder override workflow

Goal

Create the structured commercial brain.

Phase 2 — Internal Sales Copilot

Deliverables

lead intelligence dashboard

live discovery assistant

CRM sync

score and routing engine

proposal readiness engine

Goal

Improve internal discovery and reduce founder dependence.

Phase 3 — External Discovery Bot

Deliverables

website/WhatsApp bot

stateful questioning

automatic lead structuring

human handoff summary

Goal

Qualify inbound leads consistently before sales handoff.

Phase 4 — Voice Prospecting Engine

Deliverables

AI outbound calling

transcript intelligence

callback routing

objection capture

review dashboard

Goal

Scale prospecting using the same entity brain.

19. Risks

Risk 1: Overloading with raw documents

Mitigation: normalize critical knowledge into structured entities.

Risk 2: Weak discovery logic

Mitigation: start with founder-reviewed question banks and override loops.

Risk 3: Overpromising by AI

Mitigation: strong commercial guardrails and required confidence thresholds.

Risk 4: Low user adoption by sales team

Mitigation: design for live call usability and measurable productivity benefits.

Risk 5: Incorrect scoring early on

Mitigation: tune scoring model with real lead outcomes and founder reviews.

20. MVP Definition

MVP Includes

core services and sub-services

top target industries

60–100 curated discovery questions

service recommendation logic

scoring engine

CRM writeback

internal sales copilot

founder review/override capture

MVP Excludes

public chatbot at launch

voice calling at launch

autonomous final pricing

autonomous proposal issuance

21. Launch Recommendation

Launch order should be: 1. Knowledge Core 2. Sales Copilot 3. CRM Intelligence Sync 4. External Discovery Bot 5. Voice Prospecting Engine

This sequence gives the fastest ROI and the safest learning loop.

22. Final Recommendation

AIM should build this first as an internal commercial intelligence and discovery copilot, not as a public chatbot.

Reason: - internal copilot creates immediate value - improves lead quality and CRM quality - generates training data - validates discovery logic safely - reduces founder dependency before customer-facing automation

Once internal discovery is strong, the same brain can power inbound chatbot and outbound AI calling with much higher accuracy and much lower risk.

23. Next Document to Create

After this PRD, the recommended next documents are: 1. Functional specification by module 2. CRM field mapping sheet 3. Knowledge model / ontology document 4. User stories and acceptance criteria 5. API and integration specification 6. Wireframes for dashboard and copilot screens 7. Rollout plan with owners and milestones

24. Module-wise Functional Specification

24.1 Module: Knowledge Core

Purpose

Store and manage AIM’s structured commercial intelligence.

Inputs

service definitions

sub-service definitions

industry playbooks

discovery questions

pricing bands

case studies

objections

proposal modules

execution constraints

version changes

Core Functions

create and maintain service records

create and maintain industry records

manage question bank with conditions

manage solution rules

manage case study tagging

manage version history

activate/deactivate outdated logic

Outputs

structured knowledge objects for orchestration engine

searchable case studies and commercial assets

version-controlled service logic

Business Rules

every active service must have at least one discovery path

every service must define mandatory inputs for quote and feasibility

every question must be mapped to a field or decision purpose

outdated logic must not be used in live workflows once deactivated

Dependencies

admin panel

database

retrieval store

access control

Admin Actions

add service

edit service

archive service

add industry playbook

edit questions

adjust scoring logic references

upload case study assets

24.2 Module: Discovery Engine

Purpose

Run context-aware questioning and field-state tracking.

Inputs

current lead state

known fields

missing fields

service context

industry context

prior questions asked

confidence signals

Core Functions

classify inquiry

identify critical unknowns

select next-best question

avoid duplicate questioning

mark fields as confirmed/inferred/missing/not applicable

determine if enough information exists to proceed

Outputs

next-best question

updated field state

missing information list

discovery summary

proposal readiness signal

Business Rules

do not ask a question if field is already confirmed unless clarification is required

ask only questions relevant to current service and stage

stop discovery when minimum information threshold is reached for next step

low-confidence inference must be marked as inferred, not confirmed

Dependencies

knowledge core

orchestration engine

CRM field map

conversation layer

24.3 Module: Solution Mapper

Purpose

Translate discovered requirements into commercially relevant solution paths.

Inputs

service classification

industry classification

discovered lead attributes

solution rules

case studies

pricing references

feasibility notes

Core Functions

recommend service and sub-service mix

recommend touchpoint mix

suggest pilot vs full rollout

estimate budget band

estimate timeline band

identify relevant case studies

highlight delivery risks and dependencies

Outputs

recommended solution path

alternative options

budget band suggestion

timeline guidance

case study shortlist

risk flags

Business Rules

no final pricing commitment without approved pricing logic

if feasibility is unclear, flag human review

solution recommendations must reference only active services

24.4 Module: FitScore Engine

Purpose

Score the lead according to AIM-specific commercial logic.

Inputs

authority data

fit data

budget data

urgency data

completeness state

feasibility state

strategic value indicators

Core Functions

calculate component scores

calculate total score

assign lead band

recommend SLA level

recommend escalation path

Outputs

score breakdown

total score

confidence score

routing recommendation

Business Rules

missing critical fields should reduce completeness and confidence

high strategic value can increase priority but should not hide feasibility issues

leads above configured threshold should trigger faster assignment

24.5 Module: CRM Intelligence Sync

Purpose

Map structured lead intelligence into CRM and trigger workflow.

Inputs

lead identity data

discovered commercial fields

scores

recommendations

ownership logic

Core Functions

create new lead

update existing lead

write structured fields

create tasks

assign owner

tag SLA priority

attach discovery summary

log recommendations and missing data

Outputs

CRM record

owner assignment

task queue entries

activity log

Business Rules

required lead fields must be validated before CRM sync

existing leads should be updated, not duplicated, where match confidence is sufficient

every CRM write must be auditable

24.6 Module: Sales Copilot

Purpose

Support salespeople in live discovery, qualification, and next-step planning.

Inputs

CRM lead state

discovery engine output

score output

solution recommendations

Core Functions

display lead understanding

display missing fields

suggest next questions live

show recommended pitch angle

show case studies and risks

show proposal readiness

Outputs

salesperson guidance

improved discovery quality

faster handoff to proposal stage

Business Rules

salesperson must be able to override system suggestions

overrides must be logged with reason if they change major fields or recommendations

24.7 Module: Discovery Chatbot

Purpose

Run external prospect qualification in a structured but conversational way.

Inputs

prospect messages

channel context

discovery logic

known company/contact data

Core Functions

greet and classify inquiry

ask next-best question

maintain state across turns

summarize requirement

sync to CRM

hand off to human when appropriate

Outputs

structured lead brief

handoff summary

live lead score

Business Rules

no repetitive questions

do not request unnecessary information

escalate when prospect asks for commitments outside approved scope

preserve context across channel turns where technically possible

24.8 Module: Founder Review & Override

Purpose

Allow high-value or low-confidence leads to be reviewed and corrected by founder/sales head.

Inputs

lead summary

score

confidence status

escalation reason

system recommendation

Core Functions

show escalation context

allow approval/edit/override

log override reason

write override back into system

feed override into learning loop

Outputs

final approved direction

learning signal

updated CRM and recommendation state

Business Rules

all overrides must be logged

override should distinguish between pricing correction, service correction, discovery correction, or routing correction

24.9 Module: Learning & Evaluation Layer

Purpose

Improve the brain over time through outcomes and review.

Inputs

lead outcomes

win/loss reasons

override logs

question quality ratings

recommendation accuracy reviews

Core Functions

track performance by module

identify failure patterns

identify weak questions

identify weak scoring rules

support review cycles

suggest updates to knowledge logic

Outputs

evaluation dashboards

quality reports

update recommendations

Business Rules

only approved logic updates should affect production behavior

historical outcomes should remain linked to the version used at the time

25. User Stories

25.1 Sales Executive

As a sales executive, I want to see the missing information for a lead so that I know what to ask next.

As a sales executive, I want the system to suggest relevant questions during a call so that I can conduct better discovery.

As a sales executive, I want to know whether the lead is ready for proposal so that I do not waste time preparing incomplete quotes.

As a sales executive, I want the system to suggest the right service mix so that I can pitch confidently.

As a sales executive, I want case study recommendations relevant to the lead so that I can strengthen my conversation.

25.2 Sales Head

As a sales head, I want high-intent leads to be prioritized automatically so that the team focuses on the right opportunities.

As a sales head, I want low-confidence but high-value leads to be escalated so that important opportunities are not mishandled.

As a sales head, I want to review scoring logic and override patterns so that I can improve sales quality.

25.3 Founder

As a founder, I want the system to capture my commercial reasoning in structured form so that the company can scale beyond founder dependency.

As a founder, I want to review escalated leads with complete context so that I can intervene quickly and effectively.

As a founder, I want overrides to improve the system so that repeated corrections reduce over time.

25.4 Operations Manager

As an operations manager, I want the sales handoff to include clear deliverables, assumptions, and risks so that execution planning is accurate.

As an operations manager, I want feasibility-sensitive leads to be flagged early so that sales does not overpromise.

25.5 CRM Admin

As a CRM admin, I want structured field mapping from conversations so that lead records remain clean and useful.

As a CRM admin, I want duplicate lead checks before sync so that the CRM stays reliable.

25.6 External Prospect

As a prospect, I want the chatbot to ask relevant questions without repetition so that the experience feels intelligent and professional.

As a prospect, I want the system to understand my requirement before transferring me to a salesperson so that I do not have to repeat myself.

26. Acceptance Criteria

26.1 Knowledge Core

Admin can create, edit, archive, and version services.

Admin can attach mandatory discovery fields to each active service.

Admin can map each question to a field or decision purpose.

Archived service logic is not used in new live recommendations.

26.2 Discovery Engine

System does not ask a field-confirming question again unless clarification is needed.

System selects questions based on service, industry, stage, and missing critical fields.

System marks each important field as confirmed, inferred, missing, or not applicable.

System can indicate when sufficient information exists for the next stage.

26.3 Solution Mapper

System provides at least one recommended solution path when minimum discovery threshold is met.

System includes risk flags when feasibility-related data is weak or missing.

System does not generate solution recommendations using inactive services.

26.4 FitScore Engine

System calculates and stores component-wise score breakdown.

System assigns lead band based on configured thresholds.

System recalculates score when critical new answers are added.

26.5 CRM Intelligence Sync

System can create a new lead with required structured fields.

System can update an existing lead without creating duplicates where match logic is satisfied.

Every CRM write action is logged with timestamp and source.

26.6 Sales Copilot

Sales user can see known fields, missing fields, score, and next-best questions in one view.

Sales user can submit an override to system suggestions.

Override reason is stored for review when major changes are made.

26.7 Discovery Chatbot

Bot can maintain context across at least one multi-turn discovery flow.

Bot avoids duplicate questions within the same conversation.

Bot can produce a structured lead summary before human handoff.

Bot can hand off to human when low confidence or out-of-scope request is detected.

26.8 Founder Review

Escalated lead shows score, confidence, summary, risks, and recommendation in one place.

Founder can approve, edit, or override system recommendation.

Override is recorded and sent to learning layer.

26.9 Learning Layer

System stores lead outcome and override events.

System can report question quality and recommendation accuracy trends.

Logic updates require approval before being activated in production.

27. Screen-wise Requirements

27.1 Screen: Lead Intelligence Dashboard

Must Display

lead profile header

company/contact details

source channel

service classification

score breakdown

confidence indicator

proposal readiness status

missing information list

recommended next action

Actions

open discovery panel

assign owner

escalate for review

sync/update CRM

open related case studies

27.2 Screen: Live Discovery Assistant

Must Display

current conversation transcript or notes

questions already asked

next-best question suggestions

field status tracker

answer capture inputs

Actions

mark answer as confirmed

edit inferred values

skip question with reason

request founder review

27.3 Screen: Solution Recommendation Panel

Must Display

recommended service mix

recommended touchpoints

estimated budget band

estimated timeline band

case study suggestions

assumptions

risks and exclusions

Actions

accept recommendation

choose alternative recommendation

send to proposal stage

escalate

27.4 Screen: Founder Review Panel

Must Display

escalation reason

system summary

system score

confidence status

recommendation

override history if any

Actions

approve

edit fields

override recommendation

change owner

send feedback to system

27.5 Screen: Knowledge Admin Panel

Must Display

list of services

list of industries

list of question banks

version history

active/inactive status

Actions

add/edit/archive entries

change question conditions

upload case studies

publish new version

28. Workflow State Definitions

30. Release Plan by Sprint Theme

Sprint Theme 1

finalize data model

finalize service taxonomy

finalize question bank framework

Sprint Theme 2

build knowledge admin layer

build service and industry records

build field-state model

Sprint Theme 3

build discovery engine logic

build next-best question selector

build scoring engine

Sprint Theme 4

build lead intelligence dashboard

build sales copilot interface

build CRM sync

Sprint Theme 5

founder review workflow

override logging

evaluation dashboard basics

Sprint Theme 6

external discovery bot beta

handoff summary generation

pilot testing with selected inbound channels

31. Recommended Next Deliverables

The next documents to create after this functional specification are: 1. Detailed CRM field mapping sheet 2. Service taxonomy sheet 3. Discovery question matrix by service and industry 4. Scoring model configuration sheet 5. Wireframes for dashboard, copilot, and founder review screens 6. API contract and event schema 7. Pilot rollout plan with ownership and milestones

32. Detailed CRM Field Mapping Sheet

This section defines the recommended CRM field structure for AIM Entity Brain.

The objective is to ensure that every discovery conversation produces: - clean structured CRM data - commercially useful lead records - reliable routing and prioritization - proposal-readiness visibility - auditability of inferred vs confirmed information

Field Design Principles

Every critical commercial field must have a clear source.

Important fields should distinguish between confirmed and inferred values.

Fields should support both human entry and AI-generated updates.

CRM fields must support downstream actions such as assignment, SLA, proposal preparation, and escalation.

Free-text notes should not replace structured fields for core qualification data.

32.1 Lead Identity Fields

32.2 Company Intelligence Fields

32.3 Contact Authority Fields

Recommended Decision Maker Status Values

Final Decision Maker

Strong Influencer

Evaluator / Researcher

Procurement Only

Agency Intermediary

Unknown

32.4 Requirement Classification Fields

Recommended Inquiry Type Values

New Requirement

Repeat Requirement

Capability Check

Budgetary Exploration

Proposal Follow-up

Partnership Inquiry

Vendor Registration

32.5 Timeline and Volume Fields

Recommended Timeline Urgency Values

Immediate (0–7 days)

Within 30 Days

Within Quarter

Exploratory / No Fixed Timeline

32.6 Budget and Commercial Fields

Recommended Budget Band Values

Below 1L

1L–3L

3L–10L

10L–25L

25L+

Unknown

32.7 Qualification and Discovery Fields

Recommended Proposal Readiness Values

Ready for Capability Deck

Ready for Budgetary Estimate

Ready for Scoped Proposal

Needs Human Review

32.8 Scoring Fields

Recommended Lead Priority Bands

High Intent Priority

Qualified Priority

Nurture / Clarify

Low Priority

Disqualify

32.9 Routing and Ownership Fields

Recommended Next Action Values

Schedule Discovery Call

Send Capability Deck

Send Budgetary Estimate

Prepare Proposal

Founder Review

Nurture

Disqualify

32.10 Solution Recommendation Fields

32.11 Channel Conversation Fields

32.12 Audit and Learning Fields

32.13 Required Minimum Field Set by Stage

Stage: New Lead

Required minimum: - lead_id - company_name or phone/email - source_channel - lead_origin_type - first_contact_timestamp

Stage: Discovery In Progress

Required minimum: - service_category - industry_primary - requirement_summary - discovery_stage - requirement_completeness_score - next_best_question

Stage: Qualified / Assigned

Required minimum: - total_lead_score - lead_priority_band - recommended_owner_team - SLA_priority - proposal_readiness_status - missing_information_summary

Stage: Proposal Ready

Required minimum: - service_category - sub_service_category (if known) - campaign_objective_primary - target_geography - timeline_urgency_band - budget_band - proposal_readiness_status - assumptions - risk_flags

32.14 Field Source Hierarchy

When multiple sources provide values, use this order unless manually overridden: 1. Human-confirmed user input 2. Founder / sales head override 3. Salesperson confirmed entry 4. Reliable system enrichment 5. AI inference

Rule

If AI inference conflicts with human-confirmed data, human-confirmed data wins.

32.15 Recommended CRM Object Structure

Lead Object

Stores primary lead identity and qualification state.

Account Object

Stores company-level long-term information.

Contact Object

Stores contact-level person details.

Opportunity Object

Created when lead reaches commercial seriousness threshold.

Activity Object

Stores calls, chats, emails, tasks, and follow-up actions.

Intelligence Snapshot Object

Stores AI-generated summary, scores, recommendation, assumptions, and confidence state for each major interaction cycle.

32.16 Recommended System Events

lead.created

lead.updated

discovery.started

discovery.answer.captured

discovery.completed

score.updated

owner.assigned

escalation.triggered

proposal.readiness.changed

founder.override.created

outcome.recorded

These events will help product and engineering maintain auditability and workflow automation.

32.17 Implementation Notes

Use structured enums wherever possible for routing-critical fields.

Keep requirement_summary, missing_information_summary, assumptions, and risk_flags as generated long-text fields, but do not depend only on them.

Preserve all major AI writes with timestamps and version metadata.

Keep score components stored separately, not just the total score.

Ensure duplicate detection uses phone, email, company, and source-side identifiers where available.

Make proposal_readiness_status and quote_readiness_status separate fields.

Every field updated by AI should carry a traceable source or origin in the data_origin_map.

32.18 Recommended Next Document

After this CRM mapping sheet, the next most important document is: Service Taxonomy + Discovery Question Matrix by Service and Industry

That will define exactly what AIM sells, where it fits, and what the system must ask before recommending or quoting.

33. Service Taxonomy Sheet

This section defines the recommended AIM service taxonomy for the first production version of the Entity Brain.

The purpose of this taxonomy is to ensure that the system can: - classify inquiries correctly - understand service fit and misfit - know what information is required before quoting - know what information is required before feasibility confirmation - map requirements into the correct commercial path

Taxonomy Design Principles

Start with a limited number of commercially meaningful service categories.

Separate service categories from touchpoints.

Distinguish quote inputs from feasibility inputs.

Define misfit cases clearly so the system knows when not to push a service.

Ensure each active service has at least one discovery path and one proposal path.

33.1 AIM Core Service Categories

Level 1 Categories

Product Sampling

On-Ground Brand Activation

Retail / In-Store Branding

Transit / Mobile Outreach

Residential Community Outreach

Corporate / Workplace Outreach

College / Youth Outreach

Fitness / Lifestyle Outreach

Mall / Public Venue Activation

Hybrid Campaign Solutions

Notes

Some categories are solution categories.

Some are execution environment categories.

For the Entity Brain, this is acceptable as long as the system clearly maps service logic and touchpoint logic separately.

33.2 Service Taxonomy Table

33.3 Detailed Service Definitions

33.3.1 Product Sampling

Description

AIM executes controlled product trial campaigns across selected touchpoints to drive awareness, trial, and in some cases conversion or attribution.

Primary Use Cases

product launches

new market entry

consumer trial

sell-out support

brand awareness with sampling

trial-to-conversion campaigns

Typical Industries

FMCG

beauty and skincare

personal care

wellness and nutrition

beverages and food

baby care

pet care

menstrual hygiene

Core Deliverables

touchpoint planning

promoter deployment

sample distribution

interaction or engagement execution

reporting and proof of execution

optional feedback capture

optional redemption or conversion-linked mechanism

Mandatory Quote Inputs

product category

city/cities

target audience

planned scale or sample volume

desired timeline

preferred touchpoints

Mandatory Feasibility Inputs

permission dependency

sample handling/storage constraints

staff requirement

venue access model

activation hours or timing restrictions

Common Risks

unclear target audience

unrealistic timeline

mismatch between brand and touchpoint

insufficient permissions lead time

no clarity on sample volume

33.3.2 On-Ground Brand Activation

Description

AIM creates interactive brand experiences to drive engagement, education, recall, and trial.

Primary Use Cases

new launches

experiential engagement

product demonstration

lead generation in physical environments

recall campaigns

Typical Industries

consumer brands

personal care

wellness

FMCG

electronics and appliance retail tie-ins

Mandatory Quote Inputs

venue type

activation objective

duration

branding scope

promoter/staffing expectation

Mandatory Feasibility Inputs

space availability

fabrication requirements

venue permissions

power or display requirements

safety or compliance restrictions

33.3.3 Retail / In-Store Branding

Description

AIM executes store-level visual branding and shopper visibility solutions.

Primary Use Cases

retail launch visibility

store branding rollout

shelf impact improvement

shopper conversion support

Mandatory Quote Inputs

store count

city/cities

element types required

quantity per store

execution timeline

Mandatory Feasibility Inputs

store measurement availability

retailer approvals

material specifications

installation windows

access conditions

33.3.4 Transit / Mobile Outreach

Description

AIM executes route-based, vehicle-based, or transit-facing brand visibility campaigns.

Primary Use Cases

awareness campaigns

launch buzz

route-based reach

hyperlocal visibility

Mandatory Quote Inputs

city

vehicle type

duration

quantity

date range

Mandatory Feasibility Inputs

inventory availability

local permissions

route constraints

branding production lead time

33.3.5 Hybrid Campaign Solutions

Description

AIM combines multiple touchpoints under one campaign objective for broader relevance and reach.

Primary Use Cases

multi-audience launch

pilot + scale rollout

integrated visibility + trial campaign

category education across multiple environments

Mandatory Quote Inputs

campaign objective

target segments

geography

budget band

timeline

Mandatory Feasibility Inputs

cross-touchpoint ops readiness

permissions dependency map

staffing availability

reporting framework needs

33.4 Industry Fit Notes

33.5 Service Misfit Logic

The Entity Brain should explicitly disqualify or deprioritize opportunities when any of the below are true: - the requested touchpoint does not match the target audience - the lead wants a firm quote without minimum commercial information - timeline is too short relative to permission and ops dependencies - product category is incompatible with venue or audience - stated budget is far below realistic threshold and client shows no flexibility - client expectation depends on outcomes not reasonably controllable by the service - there is no viable permission or access route

34. Discovery Question Matrix by Service and Industry

This matrix defines what the Entity Brain should ask before recommending, scoring, routing, or quoting.

Matrix Design Principles

Questions must have a purpose.

Questions must map to a field or decision.

The system should distinguish must-ask from nice-to-have.

The system should know which question affects quote, feasibility, score, or case-study selection.

The system should not ask the same question in multiple ways unless clarification is needed.

Question Type Tags

Must Ask = essential for qualification or solutioning

Quote Critical = required before meaningful budgetary estimate or proposal

Feasibility Critical = required before delivery confidence

Scoring Critical = affects lead quality or routing

Optional Depth = helpful, not mandatory in first pass

34.1 Universal Discovery Core Questions

These questions apply to almost all services.

34.2 Product Sampling — Core Discovery Matrix

34.3 IT Park Sampling — Service-Specific Questions

34.4 RWA / Apartment Sampling — Service-Specific Questions

34.5 Mall Sampling / Mall Activation — Service-Specific Questions

34.6 In-Store / Retail Sampling — Service-Specific Questions

34.7 College / Youth Sampling — Service-Specific Questions

34.8 Gym / Fitness Sampling — Service-Specific Questions

34.9 Brand Activation / Kiosk — Service-Specific Questions

34.10 Retail / In-Store Branding — Service-Specific Questions

34.11 LED Van / Mobile Outreach — Service-Specific Questions

34.12 Hybrid / Multi-Touchpoint Campaign — Service-Specific Questions

34.13 Industry-Specific Question Add-Ons

FMCG / Foods / Snacks

Beauty / Skincare / Personal Care

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

34.14 Question Priority Rules

The Entity Brain should use the following order when choosing the next question: 1. Questions required to understand objective and audience 2. Questions required to identify service fit 3. Questions required to assess timeline and feasibility 4. Questions required to understand scale and budget 5. Questions required to refine proposal quality 6. Optional depth questions only after the above are sufficiently answered

34.15 Stop Rules for Discovery

Discovery should pause and route to the next stage when: - objective is known - target audience is known - geography is known - probable service fit is known - timeline is known at least in band form - budget is known or reasonably inferred for next step - critical feasibility blockers are either known or flagged

If these are not available, the system should not mark the lead as proposal-ready.

34.16 Escalation Rules During Discovery

Escalate to founder or sales head when: - high-value brand but very low confidence - requirement spans multiple service categories with unclear commercial priority - prospect requests final pricing too early without critical data - service fit is ambiguous or appears weak - feasibility risk is high due to timeline, permissions, or category sensitivity - the prospect is a strategic account or marquee brand

34.17 Recommended Next Document

After this Service Taxonomy and Discovery Matrix, the next strongest document is: Scoring Configuration Sheet + Wireframes for Lead Intelligence Dashboard and Live Discovery Assistant

That will convert the logic into usable system behavior and UI structure.

35. Scoring Configuration Sheet

This section defines the detailed scoring logic for AIM Entity Brain.

The purpose of the scoring model is to help AIM: - prioritize the right leads quickly - reduce effort spent on low-fit opportunities - route leads to the right salesperson or escalation path - create a consistent commercial qualification standard across the team - separate exciting leads from actually viable leads

Scoring Design Principles

Score for commercial quality, not just surface interest.

Keep component scores visible; never rely only on one total score.

Distinguish lead attractiveness from execution feasibility.

Penalize missing critical data through completeness and confidence.

Allow founder override, but record it as a learning signal.

35.1 Scoring Model Overview

Total Score = 100

35.2 Fit Score Configuration (0–25)

Objective

Measure how well the lead’s need matches AIM’s services, execution models, and target categories.

Negative Adjustments

Guidance

20–25 = strong fit

14–19 = moderate fit

8–13 = weak fit

below 8 = poor fit or probable misfit

35.3 Authority Score Configuration (0–15)

Objective

Measure whether AIM is speaking to someone who can influence or close the buying decision.

Positive Modifiers

Cap Rule

Authority Score cannot exceed 15.

35.4 Urgency Score Configuration (0–15)

Objective

Measure how time-bound and sales-actionable the opportunity is.

Negative Adjustments

Guidance

Urgency should not overpower feasibility. A rushed but impossible lead is not high-quality.

35.5 Budget Score Configuration (0–15)

Objective

Measure commercial seriousness and likely budget alignment with the probable solution.

Positive Modifiers

Negative Adjustments

Cap Rule

Budget Score cannot exceed 15.

35.6 Completeness Score Configuration (0–10)

Objective

Measure whether enough commercial information exists for meaningful next action.

Critical Fields Considered

service category

campaign objective

target audience

target geography

timeline

scale or sample volume

decision maker status

budget band or budget orientation

Rules

inferred fields contribute less than confirmed fields when calculating completeness confidence

if service category is unknown, completeness cannot exceed 4

if objective is unknown, completeness cannot exceed 5

35.7 Strategic Value Score Configuration (0–10)

Objective

Measure longer-term business value beyond immediate project size.

Rules

Strategic value can increase priority, but cannot override severe feasibility issues.

35.8 Feasibility Score Configuration (0–10)

Objective

Measure whether AIM can realistically execute the requirement as discussed.

Negative Adjustments

Guidance

8–10 = strong feasibility

5–7 = feasible with caution

2–4 = weak feasibility

0–1 = likely not feasible without major clarification

35.9 Confidence Score Configuration (0–100)

Confidence is separate from lead quality.

Objective

Measure how reliable the system’s understanding and recommendations are.

Confidence Inputs

Confidence Bands

80–100 = High Confidence

60–79 = Medium Confidence

Below 60 = Low Confidence

Rules

high-value leads with low confidence should escalate

low confidence should suppress premature proposal-ready status

confidence should drop when fields are contradictory or mostly inferred

35.10 Lead Priority Band Logic

35.11 Routing Rules by Score and Confidence

35.12 SLA Recommendation Rules

35.13 Proposal Readiness Rules Based on Score + Completeness

A lead may be marked:

Ready for Capability Deck

If: - objective known - probable service fit known - target audience known - geography known

Ready for Budgetary Estimate

If: - above capability deck conditions met - timeline band known - scale band or rough volume known - budget orientation known or pilot openness exists

Ready for Scoped Proposal

If: - service/sub-service reasonably clear - geography clear - objective clear - timeline clear - scale clear - budget band known or commercial path agreed - feasibility risk not high - confidence at least medium

Needs Human Review

If: - high value but low confidence - ambiguous service fit - high-risk feasibility - client insists on final quote too early

35.14 Escalation Trigger Rules

Escalate when any of the following is true: - total score >= 80 and confidence < 60 - strategic value score >= 8 and service fit is ambiguous - feasibility score <= 3 but urgency score >= 10 - budget mismatch severe but brand value is high - opportunity spans multiple service lines with unclear primary path - prospect is a marquee account, key founder connection, or board-level contact

35.15 Example Scoring Scenarios

Example A: Strong Skincare Launch Lead

brand manager from known beauty brand

wants Bangalore IT park + mall trial campaign

launch within 30 days

decent budget band disclosed

target audience clear

scale reasonably known

Suggested score: - Fit: 22 - Authority: 11 - Urgency: 12 - Budget: 12 - Completeness: 8 - Strategic: 7 - Feasibility: 7 - Total: 79 - Confidence: 82

Routing: standard qualified priority with fast assignment.

Example B: Marquee Brand, Vague Brief

well-known FMCG brand

asks for “something impactful pan-India”

no budget, no specific audience, no timeline clarity

contact is mid-level marketing executive

Suggested score: - Fit: 15 - Authority: 8 - Urgency: 4 - Budget: 3 - Completeness: 3 - Strategic: 9 - Feasibility: 3 - Total: 45 - Confidence: 42

Routing: founder/sales head review because strategic value is high but clarity is poor.

Example C: Low-Budget Misfit Lead

unknown brand

asks for premium mall activation in multiple cities

budget extremely low and fixed

wants final quote immediately

Suggested score: - Fit: 8 - Authority: 6 - Urgency: 9 - Budget: 1 - Completeness: 5 - Strategic: 2 - Feasibility: 2 - Total: 33 - Confidence: 68

Routing: low priority or disqualify unless client agrees to re-scope.

35.16 Override Rules

Human override should be allowed for: - score correction - strategic value correction - authority correction - feasibility reassessment - routing reassignment

Override Logging Must Capture

who overrode

what changed

why it changed

date/time

logic version originally used

35.17 Recommended Configurability

The following should be admin-configurable: - point values by score band - routing thresholds - SLA thresholds - escalation triggers - strategic account rules - service-specific penalties - proposal readiness gates

35.18 Recommended Next UI Behavior Tied to Scoring

show component scores, not only total score

visually highlight missing critical fields that are reducing score/confidence

display why a score was assigned in plain language

allow human edit for corrected data before score recalculation

clearly show when a high-value lead is being escalated because of low confidence

36. Wireframe Requirements

This section defines the UI structure for the first product version.

The aim is not visual design polish yet. The aim is to make the product buildable by defining the screen structure, information hierarchy, and primary actions.

36.1 Screen: Lead Intelligence Dashboard

Goal

Give sales and leadership a single-pane commercial view of a lead.

Main Sections

Lead Header

Qualification Snapshot

Score and Confidence Panel

Requirement Summary

Missing Information

Recommended Next Step

Solution Recommendation

Case Study Suggestions

Activity Timeline

Layout Suggestion

Left column: lead identity, contact info, company info

Center column: requirement summary, missing data, next questions

Right column: scores, routing, confidence, proposal readiness, escalation flags

Fields to Show

company name

contact name and designation

source channel

service category

sub-service category

industry

target audience summary

geography

timeline band

budget band

total score

component scores

confidence band

proposal readiness

assigned owner

escalation/founder review flag

Key Actions

assign owner

open live discovery assistant

mark as escalate

view recommended case studies

open CRM record

move to proposal stage

log override

Acceptance Criteria

user can understand lead quality in under 30 seconds

user can identify missing critical data without opening another screen

score and confidence are visible at first glance

36.2 Screen: Live Discovery Assistant

Goal

Help salesperson or bot run structured discovery without repetition.

Main Sections

Conversation Stream / Notes

Field Status Tracker

Next-Best Question Suggestions

Captured Answers

Recommendation Preview

Quick Actions

Layout Suggestion

Left panel: transcript or conversation notes

Center panel: structured answer cards and next question suggestions

Right panel: field status, score changes, confidence changes, proposal readiness

Fields to Show

asked questions

skipped questions and reasons

confirmed fields

inferred fields

missing critical fields

next-best questions

current score snapshot

confidence snapshot

Key Actions

ask suggested question

mark answer confirmed

edit field manually

skip question with reason

request founder review

recalculate score

generate summary

Acceptance Criteria

system does not repeat confirmed questions

user can see why the next question is being suggested

score updates after major answer capture

36.3 Screen: Solution Recommendation Panel

Goal

Show the recommended commercial path clearly and explain why it fits.

Main Sections

Primary Recommendation

Alternative Recommendation(s)

Why This Fits

Budget and Timeline Guidance

Risks and Assumptions

Supporting Case Studies

Fields to Show

recommended service mix

recommended touchpoint mix

campaign model (pilot / rollout)

budget band

timeline band

assumptions

exclusions

risks

case study links

Key Actions

accept recommendation

compare alternatives

send to proposal prep

escalate for human review

Acceptance Criteria

user can distinguish recommendation from assumption

user can see at least one reason behind each recommendation

unsupported inactive services are never shown

36.4 Screen: Founder Review Panel

Goal

Allow founder or sales head to quickly correct, approve, or redirect important leads.

Main Sections

Escalation Summary

Lead Snapshot

System Recommendation

Risk / Confidence Indicators

Override Controls

Change Log

Fields to Show

escalation reason

total score and confidence

strategic value score

feasibility score

discovery summary

missing information

recommendation

prior overrides if any

Key Actions

approve recommendation

edit fields

change owner

force proposal stage

mark nurture/disqualify

submit override reason

Acceptance Criteria

founder can make a decision in under 2 minutes for normal escalations

all overrides are logged with reason

system recommendation remains visible alongside override

36.5 Screen: Knowledge Admin Panel

Goal

Allow admin or product team to maintain service logic and question logic.

Main Sections

Services

Industries

Question Banks

Scoring Config

Version History

Case Study Tags

Key Actions

create/edit/archive service

update question conditions

update scoring thresholds

activate new version

rollback version if needed

Acceptance Criteria

admin can update active logic without breaking historical records

version history is visible and searchable

only approved users can publish logic changes

36.6 Cross-Screen Design Requirements

Required Global UI Elements

lead score chip

confidence chip

proposal readiness chip

source channel badge

escalation badge

last updated timestamp

logic version indicator

Required Behaviors

every important AI-generated field should be traceable

human-edited fields should show override marker

screen should clearly separate confirmed vs inferred data

critical missing fields should be visually highlighted

36.7 Recommended Prototype Order

Build wireframes/prototypes in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel

This order matches the sequence of highest business value for AIM.

36.8 Recommended Next Document

After this scoring sheet and wireframe spec, the next most useful document is: API Contract + Event Schema + Pilot Rollout Plan

That will give engineering integration clarity and give leadership a phased implementation path.

37. API Contract Specification

This section defines the recommended API surface for AIM Entity Brain.

The API layer should support: - lead intake - discovery progression - scoring - recommendation generation - CRM sync - founder override - analytics and audit retrieval

API Design Principles

Keep business objects explicit and versioned.

Separate synchronous response APIs from event-driven workflow updates.

Ensure all AI-generated outputs can be traced to model version and logic version.

Use structured request and response bodies.

Keep human override endpoints first-class, not as afterthoughts.

Base Objects

Lead

Discovery Session

Discovery Answer

Score Snapshot

Recommendation Snapshot

CRM Sync Result

Override Record

Outcome Record

Knowledge Version

37.1 API Authentication and Access Model

Recommended Access Types

Internal Service Token for backend-to-backend integrations

Role-based User Auth for admin, sales, founder, ops, CRM admin

Channel Auth for website bot, WhatsApp connector, and later voice stack

Recommended Roles

Admin

Sales User

Sales Head

Founder Reviewer

Ops User

CRM Admin

Read-Only Analytics User

Authorization Rules

Sales users can read and update assigned leads and discovery sessions

Founders and sales heads can override recommendations and scores

Admins can update knowledge logic, scoring thresholds, and service records

CRM Admins can manage sync configuration and duplicate detection rules

37.2 Lead Intake API

Endpoint

POST /api/v1/leads/intake

Purpose

Create or update an incoming lead from website, WhatsApp, email, phone, or manual entry.

Request Body

{
"source_channel": "website",
"lead_origin_type": "inbound",
"company_name": "Example Brand",
"contact_name": "Priya Sharma",
"designation": "Brand Manager",
"email": "priya@example.com",
"phone": "+919999999999",
"raw_message": "We want to do a skincare sampling campaign in Bangalore.",
"campaign_source": "google_ads",
"campaign_medium": "cpc",
"campaign_name": "sampling_q2"
}

Response Body

{
"lead_id": "LD-000124",
"matched_existing_lead": false,
"discovery_session_id": "DS-00987",
"classification_status": "pending",
"message": "Lead intake successful"
}

Rules

duplicate detection should run before creating a new lead

if confidence of duplicate match is high, update existing lead instead of creating new one

raw inbound message should be stored separately from structured summary

37.3 Lead Classification API

Endpoint

POST /api/v1/leads/{lead_id}/classify

Purpose

Classify service category, industry, probable objective, and priority context from existing lead data.

Response Body

{
"lead_id": "LD-000124",
"industry_primary": "Beauty / Skincare",

"service_category": "Product Sampling",
"sub_service_category": "IT Park Sampling",
"campaign_objective_primary": "Product Trial",
"confidence_score": 74,
"logic_version_used": "v1.0.3",
"model_version_used": "gpt-x.x"
}

Rules

classification should always preserve confidence and origin metadata

if classification confidence is low, discovery should remain broad until clarified

37.4 Discovery Session Create API

Endpoint

POST /api/v1/discovery-sessions

Purpose

Create a structured discovery session tied to a lead.

Request Body

{
"lead_id": "LD-000124",
"channel": "sales_copilot",
"initiated_by": "sales_user_17"
}

Response Body

{
"discovery_session_id": "DS-00987",
"lead_id": "LD-000124",
"status": "active"
}

37.5 Next-Best Question API

Endpoint

GET /api/v1/discovery-sessions/{discovery_session_id}/next-question

Purpose

Return the most relevant next question based on current field state.

Response Body

{

"question_id": "Q-112",
"question_text": "Approximately how many samples are you planning to deploy in phase 1?",
"question_type": "Quote Critical",
"reason": "Sample volume is required to estimate campaign scope and budget band.",
"field_to_populate": "sample_volume_estimate",
"priority": 1
}

Rules

must not return a question already confirmed unless clarification flag exists

should include plain-language reason so the salesperson understands why it matters

37.6 Discovery Answer Capture API

Endpoint

POST /api/v1/discovery-sessions/{discovery_session_id}/answers

Purpose

Capture a prospect answer and update structured fields.

Request Body

{
"question_id": "Q-112",
"answer_text": "We are planning around 10,000 units for the first phase.",
"captured_by": "sales_user_17",
"answer_source": "human_entered"
}

Response Body

{
"lead_id": "LD-000124",
"updated_fields": [
{
"field": "sample_volume_estimate",
"value": 10000,
"status": "confirmed"
}
],
"score_recalculated": true,
"proposal_readiness_status": "Ready for Budgetary Estimate"

}

Rules

every captured answer should generate field updates, audit records, and optional score recalculation

AI-normalized values should preserve original answer text for traceability

37.7 Discovery Summary API

Endpoint

GET /api/v1/leads/{lead_id}/discovery-summary

Purpose

Return a structured summary of all known, inferred, and missing commercial information.

Response Body

{

"lead_id": "LD-000124",

"summary": "Beauty brand exploring Bangalore IT park sampling for skincare launch within 30 days.",

"confirmed_fields": {

"industry_primary": "Beauty / Skincare",

"service_category": "Product Sampling",

"sample_volume_estimate": 10000

},

"inferred_fields": {

"budget_band": "3L–10L"

},

"missing_fields": [

"exact touchpoint split",

"branding scope"

]

}

37.8 Score Calculation API

Endpoint

POST /api/v1/leads/{lead_id}/score

Purpose

Recalculate all component scores and total lead score.

Response Body

{

"lead_id": "LD-000124",

"fit_score": 22,

"authority_score": 11,

"urgency_score": 12,

"budget_score": 10,

"completeness_score": 8,

"strategic_value_score": 6,

"feasibility_score": 7,

"total_lead_score": 76,

"lead_priority_band": "Qualified Priority",

"confidence_score": 81,

"confidence_band": "High"

}

Rules

every scoring response must include component-level outputs

score recalculation should happen automatically after critical field changes and optionally on demand

37.9 Recommendation API

Endpoint

POST /api/v1/leads/{lead_id}/recommendation

Purpose

Generate service, touchpoint, and next-step recommendation.

Response Body

{

"lead_id": "LD-000124",

"recommended_service_mix": [

"IT Park Sampling",

"Mall Sampling"

],

"recommended_campaign_model": "Pilot",

"budget_band": "3L–10L",

"timeline_band": "Within 30 Days",

"recommended_case_studies": [

"CS-101",

"CS-117"

],
"risks": [
"Branding scope not yet defined"
],
"assumptions": [
"Single-city phase 1"
]
}

Rules

should not generate unsupported service recommendations

must preserve assumptions explicitly

low confidence recommendations should include human review flag

37.10 Proposal Readiness API

Endpoint

GET /api/v1/leads/{lead_id}/proposal-readiness

Purpose

Return readiness status for capability deck, budgetary estimate, or scoped proposal.

Response Body

{
"lead_id": "LD-000124",
"proposal_readiness_status": "Ready for Budgetary Estimate",
"quote_readiness_status": "Needs More Discovery",
"missing_critical_fields": [
"branding scope"
],
"recommended_next_action": "Clarify branding requirement before final proposal"
}

37.11 CRM Sync API

Endpoint

POST /api/v1/leads/{lead_id}/sync-crm

Purpose

Push or update lead intelligence in CRM.

Response Body

{

"lead_id": "LD-000124",

"crm_record_id": "CRM-77812",

"sync_status": "success",

"updated_fields_count": 21,

"owner_assigned": "Vidhya",

"sla_priority": "High"

}

Rules

all sync attempts should create audit records

CRM sync failures should create retryable system events

37.12 Founder Override API

Endpoint

POST /api/v1/leads/{lead_id}/override

Purpose

Allow founder or sales head to modify scores, routing, service recommendations, or readiness states.

Request Body

{

"override_type": "service_correction",

"changed_fields": {

"sub_service_category": "Mall Sampling"

},

"reason": "Better TG fit for premium skincare positioning",

"overridden_by": "founder_user_01"

}

Response Body

{

"lead_id": "LD-000124",

"override_record_id": "OV-6612",

"status": "applied",

"learning_signal_created": true

}

Rules

all overrides must capture before/after values and reason

override should trigger refreshed summary and optional re-score

37.13 Outcome Logging API

Endpoint

POST /api/v1/leads/{lead_id}/outcome

Purpose

Store win/loss and outcome reason for learning and analytics.

Request Body

```
{
"outcome_status": "won",
"outcome_reason": "Budget aligned and pilot approved",
"recorded_by": "sales_head_01"
}
```

37.14 Knowledge Management APIs

Recommended Endpoints

POST /api/v1/knowledge/services

PATCH /api/v1/knowledge/services/{service_id}

POST /api/v1/knowledge/questions

PATCH /api/v1/knowledge/questions/{question_id}

POST /api/v1/knowledge/industries

POST /api/v1/knowledge/case-studies

POST /api/v1/knowledge/versions/publish

POST /api/v1/knowledge/versions/rollback

Rules

only approved roles can publish new logic version

version metadata must be preserved on all production decisions

37.15 Analytics APIs

Recommended Endpoints

GET /api/v1/analytics/lead-quality

GET /api/v1/analytics/question-quality

GET /api/v1/analytics/override-patterns

GET /api/v1/analytics/conversion-by-score-band

GET /api/v1/analytics/discovery-completeness

37.16 Error Handling Standards

Common Error Types

validation_error

duplicate_lead_conflict

knowledge_version_not_found

low_confidence_block

crm_sync_failure

permission_denied

unsupported_service_path

Error Response Format

{

"error_code": "validation_error",

"message": "service_category is required for scoring",

"details": {

"field": "service_category"

}

}

38. Event Schema Specification

This section defines the event-driven model for AIM Entity Brain.

The event layer should power: - auditability - retries - analytics - downstream integrations - async workflow automation

Event Design Principles

Every material lead-state change should emit an event.

Events should be idempotent-friendly.

Events should include source, timestamp, lead ID, and version metadata.

Failure-prone external integrations should be event-driven where possible.

Standard Event Envelope

{

"event_id": "EV-90001",

"event_type": "lead.created",

"occurred_at": "2026-04-04T12:15:00Z",

"lead_id": "LD-000124",

"source": "website_bot",

"logic_version_used": "v1.0.3",

"model_version_used": "gpt-x.x",

"payload": {}

}

38.1 Core Lead Events

lead.created

When a new lead record is created.

lead.updated

When major lead data is updated.

lead.matched_existing

When intake resolves to an existing lead rather than creating a new one.

lead.assigned

When owner/team assignment occurs.

lead.escalated

When founder or sales-head review is triggered.

lead.disqualified

When lead is marked low-fit or unviable.

38.2 Discovery Events

discovery.started

When a discovery session begins.

discovery.question.served

When next-best question is generated and shown.

discovery.answer.captured

When an answer is stored.

discovery.field.updated

When a structured field changes.

discovery.summary.generated

When a summary is refreshed.

discovery.completed

When minimum discovery threshold is reached.

38.3 Scoring and Recommendation Events

score.calculated

When score snapshot is recalculated.

confidence.updated

When confidence changes materially.

recommendation.generated

When solution recommendation is produced.

proposal.readiness.changed

When readiness status changes.

38.4 CRM and Workflow Events

crm.sync.requested

When CRM sync is triggered.

crm.sync.succeeded

When CRM sync succeeds.

crm.sync.failed

When CRM sync fails.

task.created

When follow-up or review task is created.

sla.priority.changed

When SLA classification changes.

38.5 Human Review Events

override.created

When a founder or sales head override is submitted.

override.applied

When override has been written into active lead state.

review.approved

When escalation is approved without changes.

review.reassigned

When ownership or path is changed in review.

38.6 Learning and Outcome Events

outcome.recorded

When win/loss is captured.

analytics.snapshot.generated

When periodic analytics jobs are run.

knowledge.version.published

When new logic goes live.

knowledge.version.rolled_back

When version rollback happens.

38.7 Example Event Payloads

Example: score.calculated

{

"event_id": "EV-90002",

"event_type": "score.calculated",
"occurred_at": "2026-04-04T12:30:00Z",
"lead_id": "LD-000124",
"source": "scoring_engine",
"logic_version_used": "v1.0.3",
"payload": {
"fit_score": 22,
"authority_score": 11,
"urgency_score": 12,
"budget_score": 10,
"completeness_score": 8,
"strategic_value_score": 6,
"feasibility_score": 7,
"total_lead_score": 76,
"lead_priority_band": "Qualified Priority"
}
}

Example: lead.escalated

{
"event_id": "EV-90003",
"event_type": "lead.escalated",
"occurred_at": "2026-04-04T12:35:00Z",
"lead_id": "LD-000124",
"source": "orchestrator",
"payload": {
"reason": "High value but low confidence",
"recommended_reviewer_role": "Founder Reviewer"
}
}

38.8 Event Consumers

Recommended Consumers

CRM integration worker

analytics worker

notification service

founder review queue service

task creation service

audit log service

model evaluation pipeline

38.9 Retry and Failure Handling

Recommended Rules

CRM sync failures should retry with backoff

external messaging failures should be logged and retried separately

score/recommendation failures should not corrupt existing lead state

failed async consumers should push to dead-letter queue after retry threshold

39. Pilot Rollout Plan

This section defines how AIM should launch the first working version of Entity Brain.

The goal is not to automate everything at once. The goal is to prove business value safely and quickly.

Pilot Principles

Start with high-frequency, commercially important services.

Use internal sales copilot first.

Keep founder feedback tightly looped during the pilot.

Measure both system accuracy and business impact.

Expand only after question quality and routing quality stabilize.

39.1 Recommended Pilot Scope

Phase 1 Pilot Services

Start with the services that most directly affect AIM’s current commercial motion: 1. Product Sampling - IT Park Sampling - RWA / Apartment Sampling - Mall Sampling - In-Store / Retail Sampling 2. Brand Activation - Kiosk-Based Activation - Product Demo / Trial Booth 3. Transit / Mobile Outreach - LED Van Campaign

Why These First

they are core to AIM’s sales motion

they have repeatable commercial logic

they frequently require founder intervention today

they are good training ground for discovery quality

39.2 Recommended Pilot Users

Internal Users

1 Sales Head / reviewer

2 Sales users

1 Founder reviewer

1 Ops reviewer

1 Product / admin owner

Suggested AIM Pilot Roles

Sales Head: oversight and override review

Sales Users: primary copilot users during discovery

Founder: weekly quality review and escalations

Ops: feasibility validation feedback

Admin/Product: maintain knowledge updates and scoring thresholds

39.3 Recommended Pilot Channels

Start With

manual lead entry through sales copilot

website inbound leads summarized into system

WhatsApp inbound leads processed through structured intake

Defer Initially

fully autonomous public chatbot

voice outbound automation

automated proposal generation without review

39.4 Pilot Success Criteria

Operational Success Metrics

reduction in founder interruptions per lead

increase in discovery completeness score

reduction in average time to proposal readiness

reduction in missing critical fields at proposal stage

Quality Metrics

duplicate question rate below agreed threshold

score accuracy vs sales-head review

recommendation usefulness rating from sales team

feasibility flag accuracy from ops review

Commercial Metrics

improved lead prioritization quality

faster response on high-intent leads

improved proposal conversion on qualified leads

39.5 Pilot KPI Targets (Recommended Starting Benchmarks)

These can be tuned once AIM sets a baseline.

39.6 Pilot Rollout Stages

Stage 0: Preparation (Week 1–2)

finalize pilot services

finalize scoring thresholds

finalize question banks

finalize CRM field map

onboard pilot users

define feedback review cadence

Stage 1: Internal Copilot Shadow Mode (Week 3–4)

sales team continues normal process

system runs in parallel and suggests questions/scores

compare system suggestions against actual sales actions

log gaps and override patterns

Stage 2: Assisted Live Mode (Week 5–6)

sales team actively uses copilot during discovery

founder reviews escalated leads

ops validates feasibility flags

CRM sync used for pilot leads

Stage 3: Controlled Operational Mode (Week 7–8)

selected website and WhatsApp leads enter through system

discovery summaries auto-generated

scoring/routing used for working decisions

weekly logic tuning based on outcomes

Stage 4: Pilot Review and Expansion Decision (Week 9)

review business metrics

review override patterns

review question quality

review routing accuracy

decide go/no-go for discovery bot expansion

39.7 Pilot Governance Cadence

Daily

review sync failures

review escalations

review major overrides

Weekly

founder review of top escalations

sales feedback review

ops feedback review

scoring and question quality review

End of Pilot

compare baseline vs pilot performance

identify service gaps

finalize phase 2 expansion plan

39.8 Recommended Pilot Review Template

Each week, review: - number of pilot leads processed - score distribution - confidence distribution - average completeness score - number of escalations - number of overrides - most common missing fields - most common weak questions - most common misclassification issues - proposal-readiness accuracy - notable wins/losses

39.9 Expansion Criteria After Pilot

Expand to next phase only if: - discovery quality is stable - duplicate questioning is low - sales users trust the copilot - founder override rate is reducing meaningfully - CRM sync reliability is acceptable - recommendation usefulness is consistently positive

Phase 2 Expansion Candidates

more retail branding workflows

more hybrid campaign paths

customer-facing discovery bot

Phase 3 Expansion Candidates

voice prospecting engine

semi-automated outbound qualification

deeper proposal automation

39.10 Recommended Ownership Model

39.11 Recommended Next Document

After this implementation specification, the next best documents are: 1. Figma wireframes or clickable prototype for the key screens 2. Engineering task breakdown by module 3. Data migration / knowledge ingestion plan 4. Pilot operating SOP for sales and founder reviewers

These will take AIM from planning into active build execution.

40. Engineering Task Breakdown by Module

This section translates the product specification into executable workstreams for engineering, product, and operations.

The purpose of this breakdown is to help AIM: - estimate build effort - allocate ownership across backend, frontend, product, and integrations - sequence the build properly - avoid building UI

before core logic and data structures exist

Workstream Design Principles

Build core data and logic before advanced UI.

Separate platform foundations from user-facing features.

Deliver the internal sales copilot first.

Keep every workstream testable in isolation.

Treat knowledge quality as a product dependency, not just content work.

40.1 Workstream Overview

40.2 Workstream 1: Platform Foundation

Objective

Create the underlying application infrastructure needed for secure, traceable, versioned operations.

Key Tasks

set up environments: dev, staging, production

implement auth and RBAC

define core database schema

set up audit logging framework

set up file/retrieval storage connectors

set up event bus / queue mechanism

define API versioning approach

implement observability basics (logs, metrics, errors)

Deliverables

environment setup checklist

RBAC matrix

initial database schema migrations

logging and monitoring setup

API gateway/base framework

Dependencies

none, this starts first

Acceptance Criteria

authenticated internal users can access system based on role

all API calls are logged with user/service identity

core objects can be persisted in database

40.3 Workstream 2: Knowledge Core Implementation

Objective

Build the structured knowledge layer and admin-ready data foundations.

Key Tasks

implement services table and CRUD APIs

implement sub-services table and relationships

implement industry playbook table and CRUD APIs

implement discovery question table with conditional fields

implement case-study metadata model

implement scoring config tables

implement knowledge versioning model

build import templates for structured data uploads

Deliverables

service and sub-service APIs

question bank APIs

industry playbook APIs

case-study metadata APIs

versioning schema

admin import template sheets

Dependencies

Platform Foundation

Acceptance Criteria

admin can create and retrieve structured service and question records

knowledge version can be tagged and retrieved by live engine

inactive knowledge does not appear in live recommendations

40.4 Workstream 3: Retrieval and Knowledge Access Layer

Objective

Enable the system to fetch relevant long-form context such as case studies, SOPs, and proposal archives.

Key Tasks

define retrieval corpus types

build document ingestion pipeline for approved files

tag documents with service/industry metadata

implement retrieval APIs

support filtered retrieval by service, industry, geography, and objective

store retrieval trace metadata alongside outputs

Deliverables

retrieval corpus structure

metadata schema

filtered retrieval endpoint

retrieval trace logging

Dependencies

Platform Foundation

Knowledge Core

Acceptance Criteria

system can retrieve relevant case studies based on service and industry filters

retrieval results include source metadata for auditability

40.5 Workstream 4: Orchestration Engine

Objective

Build the decision layer that runs classification, questioning, scoring, and recommendations.

Key Tasks

implement lead classification service

implement field-state manager

implement next-best-question selector

implement duplicate-question prevention logic

implement scoring engine

implement confidence engine

implement recommendation engine

implement proposal-readiness engine

implement escalation rules

Deliverables

orchestrator service

field-state logic

question selection service

scoring service

recommendation service

readiness service

Dependencies

Knowledge Core

Retrieval Layer

CRM field mapping

Acceptance Criteria

system can generate next-best question based on lead state

score updates when critical fields change

recommendation output includes assumptions and risks

low-confidence high-value leads escalate correctly

40.6 Workstream 5: Lead and Discovery APIs

Objective

Expose the engine through stable APIs for UI and integrations.

Key Tasks

build lead intake endpoint

build lead classification endpoint

build discovery session create endpoint

build answer capture endpoint

build score and recommendation endpoints

build proposal-readiness endpoint

build override endpoint

build outcome logging endpoint

Deliverables

API contracts implemented

API validation layer

API error handling and response standards

Dependencies

Orchestration Engine

Platform Foundation

Acceptance Criteria

all critical API flows work in staging

APIs return structured objects matching the contract spec

validation errors are explicit and recoverable

40.7 Workstream 6: CRM & Workflow Integration

Objective

Push lead intelligence into CRM and trigger assignment/action workflows.

Key Tasks

implement CRM create/update sync

implement duplicate lead handling logic

implement owner assignment rules

implement task creation rules

implement SLA tagging

implement sync retry handling and error logging

implement event-triggered workflow updates

Deliverables

CRM sync service

workflow task service

owner assignment engine

SLA priority logic

Dependencies

Lead and Discovery APIs

Event Schema

CRM field mapping

Acceptance Criteria

pilot leads sync into CRM with mapped structured fields

sync failures are logged and retryable

owner assignment follows routing rules

40.8 Workstream 7: Sales Copilot Frontend

Objective

Create the primary working interface for internal sales usage.

Key Tasks

build Lead Intelligence Dashboard UI

build Live Discovery Assistant UI

build score/confidence panels

build missing-field tracker UI

build summary and recommendation cards

build action buttons for assign, escalate, rescore, sync

Deliverables

sales copilot screens

responsive layouts for desktop use

state management for live discovery

Dependencies

Lead and Discovery APIs

scoring and recommendation outputs

Acceptance Criteria

salesperson can complete a structured discovery flow from one interface

UI shows confirmed vs inferred vs missing fields clearly

next-best question can be used during live calls

40.9 Workstream 8: Founder Review Frontend

Objective

Create the escalation review and override interface.

Key Tasks

build review queue screen

build Founder Review Panel

build override form and reason capture

build before/after comparison UI

build override history display

Deliverables

founder review queue

override interaction flow

audit-friendly change display

Dependencies

override APIs

score and recommendation APIs

Acceptance Criteria

founder can review and override an escalated lead quickly

every override is captured with reason and before/after state

40.10 Workstream 9: Knowledge Admin Frontend

Objective

Allow controlled maintenance of services, questions, scoring, and knowledge versions.

Key Tasks

build service management screens

build industry playbook screens

build question-bank editor

build scoring config editor

build publish/rollback version controls

build case-study metadata management interface

Deliverables

admin console for knowledge updates

publish and rollback workflow

Dependencies

Knowledge Core APIs

auth and role controls

Acceptance Criteria

authorized admin can update logic without engineering support

published logic version is visible to live engine and audit logs

40.11 Workstream 10: Analytics, Audit, and Evaluation

Objective

Measure system quality and pilot business impact.

Key Tasks

build lead-quality analytics

build override analytics

build discovery completeness analytics

build question-quality analytics

build conversion-by-score dashboards

build audit trail views

implement model trace storage for major decisions

Deliverables

pilot analytics dashboard

audit export/reporting capability

quality monitoring views

Dependencies

event schema

outcome logging

overrides

Acceptance Criteria

pilot team can review weekly quality and impact metrics

every major decision state has trace metadata available

40.12 Workstream 11: QA, Testing, and Evaluation Harness

Objective

Validate that the system behaves reliably across real AIM scenarios.

Key Tasks

create scenario test library by service and industry

create expected-answer and expected-question test cases

build regression checks for score/routing logic

build duplicate-question test set

build misfit lead test set

run founder-reviewed evaluation cycles

Deliverables

scenario library

acceptance test checklist

regression test suite

pilot issue triage template

Dependencies

all major modules

Acceptance Criteria

core scenarios pass acceptance checks before live pilot expansion

repeated regressions are visible before release

40.13 Suggested Sprint-Level Build Sequence

Sprint A

Platform Foundation

base database schema

auth and roles

event envelope setup

Sprint B

Knowledge Core APIs

import templates

service and question models

Sprint C

Orchestration basics

classification

field-state tracking

next-best question service

Sprint D

scoring engine

confidence engine

recommendation engine

readiness engine

Sprint E

lead/discovery APIs

CRM sync basics

owner assignment

Sprint F

Sales Copilot UI

Lead Intelligence Dashboard

Live Discovery Assistant

Sprint G

Founder Review UI

override flow

analytics basics

Sprint H

hardening, QA, pilot support, weekly logic tuning

40.14 Resourcing Recommendation

Minimum Practical Product Team

1 Product Owner / Product Manager

1 Backend Engineer

1 Frontend Engineer

1 Full-stack or Integration Engineer

1 QA / Test Engineer (shared is acceptable initially)

1 Knowledge Ops / Product Admin

1 Founder / Sales Head reviewer for weekly logic tuning

Optional but Valuable

1 AI / Prompt / Eval specialist

1 Data analyst for pilot measurements

40.15 Build Risk Notes

Likely Risk Areas

weak initial knowledge quality

over-complex orchestration too early

CRM sync mismatch with existing workflow

sales UI becoming too heavy for live usage

lack of consistent override reviews

Recommended Mitigation

keep pilot scope narrow

build observable state and logs first

tune on real lead scenarios weekly

keep human override easy and visible

41. Knowledge Ingestion Plan

This section defines how AIM should convert existing founder knowledge, case studies, service know-how, and past assets into usable Entity Brain knowledge.

The goal is to avoid a common failure mode: uploading lots of documents but not creating usable decision intelligence.

Ingestion Principles

Do not treat raw documents as the final brain.

Normalize critical knowledge into structured entities.

Preserve source links and provenance for every ingested fact.

Separate evergreen logic from temporary campaign-specific data.

Use founder review to validate the first structured versions.

41.1 Knowledge Source Categories

Structured Knowledge Sources

service lists

pricing frameworks

deliverable templates

approval matrices

routing rules

scoring rules

CRM fields

Semi-Structured Sources

proposals

SOWs

capability decks

case study decks

service one-pagers

questionnaire sheets

Unstructured Sources

founder voice notes or explanations

call transcripts

WhatsApp discussions

email threads

internal notes

meeting summaries

Operational Sources

execution SOPs

permission notes

city-level constraints

staffing assumptions

turnaround benchmarks

41.2 What Must Be Structured First

The first structured ingestion wave should prioritize: 1. services and sub-services 2. discovery questions 3. quote-critical inputs 4. feasibility-critical inputs 5. scoring logic 6. routing rules 7. high-value case studies 8. common objections and good responses

This is more important than bulk-importing every old document.

41.3 Ingestion Pipeline Stages

Stage 1: Inventory

Collect and list all existing knowledge assets.

Tasks

create source inventory spreadsheet

identify owner of each source

classify source type

tag source freshness

tag source business relevance

Output

A master inventory of AIM knowledge assets.

Stage 2: Prioritization

Decide what should be ingested first.

Priority Order

high-frequency services

current sales-useful documents

repeatable pricing and discovery logic

proven case studies

founder explanations of nuanced commercial decisions

Output

Ingestion priority backlog.

Stage 3: Extraction

Extract commercially relevant facts and patterns from sources.

Tasks

identify service definitions

identify required questions

identify pricing drivers

identify feasibility dependencies

identify common misfit cases

identify objections and winning pitch angles

identify scoring signals

Output

Raw extracted insight sheets by source.

Stage 4: Normalization

Convert extracted insights into structured objects.

Convert Into

service records

question bank records

case-study records

scoring config records

objection records

proposal module records

feasibility notes

Output

Structured import-ready data.

Stage 5: Validation

Have founder / sales head / ops validate structured data.

Validation Focus

is this commercially true?

is anything important missing?

is this outdated?

does this apply generally or only in specific cases?

Output

Approved version 1 structured knowledge pack.

Stage 6: Publication

Push approved knowledge to live/staging environment.

Output

Published knowledge version with changelog.

41.4 Knowledge Inventory Template

Recommended Columns

source_id

source_name

source_type

owner

service_tags

industry_tags

document_date

current_relevance

ingestion_priority

status

notes

Recommended Status Values

Not Reviewed

Prioritized

Extracted

Normalized

Validated

Published

Archived

41.5 Founder Knowledge Capture Plan

A large part of AIM’s advantage lives in founder reasoning, not documents.

Recommended Capture Methods

structured founder interviews by service

scenario-based workshops

win/loss debrief capture

proposal review deconstruction

override explanation logging during pilot

Best Format for Capture

For each service, ask founders to explain: - when this service is the right fit - when it is the wrong fit - what questions they ask first - what information they must know before quoting - what usually goes wrong - what makes a lead exciting but risky - what they would recommend instead in edge cases

Output

Founder reasoning sheets that can be normalized into rules and question banks.

41.6 Service-by-Service Ingestion Template

For each active service, capture the following: - service name - service description - ideal use cases - non-ideal use cases - best-fit industries - key target audiences - mandatory quote inputs - mandatory feasibility inputs - pricing drivers - common objections - recommended pitch angles - supporting case studies - risk notes - common substitutions or alternatives

This template should be completed before activating a service in pilot scope.

41.7 Case Study Ingestion Template

For each case study, capture: - case_study_id - client category - industry - service used - objective - target audience - geography - campaign scale - execution summary - outcome/result - lessons learned - where this case study is useful in sales - proof assets available

Important Rule

Do not store case studies only as PDFs or slides. Create metadata and structured tags first.

41.8 Proposal and SOW Ingestion Guidance

Past proposals and SOWs are valuable, but they should not be imported blindly.

Extract Only

service scope patterns

exclusions patterns

pricing drivers

deliverable blocks

assumptions patterns

client-specific modifications

Do Not Reuse Blindly

outdated pricing

one-off exceptional commercial concessions

old timelines that no longer reflect ops reality

custom clauses from unusual clients unless explicitly tagged

41.9 Objection and Pitch-Angle Ingestion Plan

The Entity Brain should know not just what AIM sells, but how AIM sells it.

Extract and Structure

common objections by service

common objections by industry

strong responses that work

proof points needed to support the response

when to shift to pilot-first recommendation

when to reposition the service mix

Example Tags

budget objection

timeline objection

feasibility objection

“why this touchpoint” objection

attribution objection

trust / credibility objection

41.10 Ops and Feasibility Knowledge Ingestion

This is critical so sales logic stays grounded.

Capture

permission dependencies by touchpoint

lead-time norms by service

production/fabrication constraints

manpower assumptions

city-specific constraints

compliance or handling considerations

reporting limitations

Why It Matters

Without this layer, the brain will oversell and under-warn.

41.11 Suggested Ingestion Sequence for AIM

Wave 1: Pilot-Critical Knowledge

Product Sampling

IT Park Sampling

RWA Sampling

Mall Sampling

In-Store Sampling

Kiosk Activation

LED Van

related case studies

related objections

related feasibility notes

Wave 2: Expansion Knowledge

retail branding

hybrid solutions

workplace activation variants

college and gym expansions

Wave 3: Advanced Learning Knowledge

call transcripts

win/loss notes

founder override logs

response quality patterns

41.12 Ingestion Roles and Ownership

41.13 Quality Checks for Ingested Knowledge

Before publishing a knowledge pack, confirm: - the service definition is current - the question set is not repetitive - quote inputs are sufficient but not excessive - feasibility notes are grounded in real ops constraints - case-study tags are accurate - scoring signals are commercially sensible - outdated pricing or one-off exceptions are excluded or clearly tagged

41.14 Knowledge Freshness Policy

Recommended Review Frequency

service logic: monthly or when service changes

pricing drivers: monthly or on commercial change

case studies: as new ones become available

feasibility rules: whenever ops constraints change

scoring logic: weekly during pilot, then monthly

Freshness Labels

Current

Needs Review

Archived

Historical Reference Only

41.15 Recommended First 30-Day Ingestion Plan

Week 1

build source inventory

prioritize pilot services

define ingestion templates

Week 2

extract and normalize pilot service logic

capture founder reasoning for pilot services

capture top 10–20 questions per pilot service

Week 3

ingest top case studies and objections

ingest feasibility constraints

validate with founder and ops

Week 4

publish v1 knowledge pack

begin pilot usage

start override-driven refinement cycle

41.16 Common Ingestion Mistakes to Avoid

uploading decks without extracting structured logic

mixing outdated and current pricing assumptions

storing founder insights only in free-text notes

failing to distinguish service rules from client-specific exceptions

skipping ops validation

activating too many services before the pilot logic is stable

41.17 Recommended Next Document

After this engineering breakdown and knowledge ingestion plan, the next strongest documents are: 1. Pilot Operating SOP for Sales, Founder Review, and Ops 2. Figma wireframe prompt / UI spec for prototype creation 3. Engineering estimation sheet by workstream and sprint

These will move AIM from planning into execution governance.

42. Pilot Operating SOP

This section defines how AIM should operate the Entity Brain during the pilot.

The purpose of this SOP is to ensure that the pilot is not treated as only a software test. It must function as an operating system test across sales, founder review, ops validation, and product/admin tuning.

SOP Principles

Sales should use the copilot during real discovery, not only after the call.

Founder review should focus on high-value ambiguity, not routine lead handling.

Ops should validate feasibility signals before overpromising becomes a pattern.

Every override and correction should improve the system.

Weekly review must convert pilot observations into logic updates.

42.1 Pilot Roles and Responsibilities

42.2 Daily Operating Flow

Step 1: Lead Intake

All pilot leads should enter through one of these routes: - direct intake into sales copilot - website lead synced into system - WhatsApp inquiry entered or connected into system

Sales User Action

open or create lead in system

review initial classification

confirm obvious identity details

start discovery session

System Action

create or update lead

classify probable service and industry

begin discovery state

suggest next-best question

42.3 Sales Discovery SOP

When to Use Copilot

Sales should use the copilot during: - first discovery call - WhatsApp clarification chat - email-based requirement clarification - follow-up call before proposal preparation

Sales User Must Do

review the lead summary before speaking

ask suggested questions where relevant

mark answers as confirmed when prospect states them clearly

correct inferred fields if needed

avoid skipping critical questions without reason

check proposal-readiness before asking for internal pricing/proposal prep

Sales User Must Not Do

ignore missing critical fields and still request final proposal

override recommendation without reason

assume inferred fields are confirmed facts

promise feasibility where the system has flagged risk without validation

Minimum Sales Checklist Before Moving Lead Forward

objective captured

target audience captured

geography captured

timeline captured in at least band form

service direction reasonably clear

budget orientation captured or at least discussed

major feasibility blockers flagged if known

42.4 Founder Review SOP

When a Lead Must Be Escalated

Escalate when: - score is high but confidence is low - lead is strategically valuable or marquee - service fit is ambiguous across multiple AIM services - client is pushing for final pricing without enough discovery - feasibility risk is high due to timeline, permissions, or category sensitivity - salesperson is unable to determine commercial direction confidently

Founder Reviewer Must Do

review system summary, score, confidence, and missing fields

assess whether the issue is discovery quality, service fit, or feasibility

approve, edit, or override the system recommendation

record override reason in clear business language

identify whether logic update is needed for similar future cases

Founder Reviewer Must Not Do

rewrite the whole brief without preserving why the system was wrong

bypass logging because the lead seems obvious

let urgent but low-feasibility leads proceed without caution notes

Target Review Time

For standard escalations, founder review should ideally be completed in a short focused window, with a practical goal of rapid turnaround during business hours.

42.5 Ops Validation SOP

When Ops Should Be Involved

Ops should validate when: - permissions are a likely blocker - timeline is aggressive - product handling/storage requirements are unclear - branding/fabrication scope affects feasibility - multi-touchpoint complexity is high - retail or venue approvals are required

Ops Reviewer Must Do

review the relevant lead summary and risk flags

confirm or correct feasibility assumptions

identify hidden ground constraints

flag unrealistic commitments before proposal stage

suggest safer execution model where needed

Ops Reviewer Output

feasible

feasible with caution

not feasible without changes

needs more information

This output should be captured in system notes and reflected in feasibility score updates.

42.6 Sales Head Monitoring SOP

Sales Head Responsibilities

review the day’s high-priority leads

review leads stuck in discovery too long

monitor whether sales team is using the copilot properly

review major override patterns

identify where training vs logic improvement is needed

Daily Review Focus

high-priority leads not yet assigned

high-score leads with missing critical fields

repeated founder escalations of the same kind

low-confidence recommendations on important leads

42.7 Product/Admin Operating SOP

Daily Responsibilities

review system errors

review CRM sync failures

review duplicate lead issues

review major logic failures reported by users

track unresolved pilot bugs

Weekly Responsibilities

prepare pilot metrics summary

prepare top override patterns

prepare top weak-question patterns

prepare top misclassification patterns

prepare knowledge update recommendations

Product/Admin Must Do

maintain issue log with severity

tag issues as product, knowledge, scoring, ops, CRM, or training

ensure approved logic changes move through version control

42.8 Daily Cadence

Start of Day

Sales Head / Product Admin should review: - open high-priority leads - pending escalations - sync failures - prior day unresolved issues

During Day

Sales users should: - use the copilot live during active discovery - escalate only when rule conditions are met - avoid offline notes that never enter the system

End of Day

Sales Head / Product Admin should review: - leads processed during the day - new overrides - leads stuck without next action - recurring missing fields

42.9 Weekly Review Cadence

A structured weekly review is mandatory during the pilot.

Participants

Founder Reviewer

Sales Head

Sales Users in pilot

Ops Reviewer

Product/Admin Owner

CRM Admin if sync issues are material

Weekly Review Agenda

total pilot leads processed

score distribution

confidence distribution

discovery completeness trends

top missing fields

top duplicate or weak questions

top founder overrides

top ops feasibility corrections

notable wins/losses from pilot leads

logic changes to approve for next version

Weekly Output

approved logic updates

training actions for sales users

CRM fixes if needed

list of scenarios to add to test harness

42.10 Lead Handling SOP by Priority Band

High Intent Priority

Sales User: - contact fast within SLA - complete discovery thoroughly - check readiness early

Sales Head: - monitor closely - step in if confidence is low or lead is strategically important

Founder: - review if escalated

Qualified Priority

Sales User: - proceed with standard discovery and proposal path - avoid rushing if critical data missing

Sales Head: - review only if stuck or if lead is large/complex

Nurture / Clarify

Sales User: - focus on missing information - do not move to detailed proposal early

Sales Head: - monitor if lead lingers too long without clarity

Low Priority / Disqualify

Sales User: - re-scope if possible - otherwise mark appropriately

Sales Head: - review only for special strategic exceptions

42.11 Override Handling SOP

When an Override Happens

The responsible reviewer must capture: - what the system said - what was changed - why it was changed - whether the problem was knowledge, scoring, workflow, or UI understanding

Override Categories

service classification correction

scoring correction

feasibility correction

routing correction

proposal-readiness correction

field accuracy correction

Rule

An override is not only an exception. It is a training signal. Every recurring override pattern must be reviewed in weekly logic tuning.

42.12 Proposal Stage Handoff SOP

Before a lead moves to proposal stage, the salesperson must verify: - proposal-readiness status is appropriate - required fields are captured - assumptions are visible - risks are visible - feasibility flags are reviewed if needed

Handoff Package Should Include

requirement summary

confirmed fields

inferred fields

missing but non-blocking fields

score summary

recommended service path

assumptions

risk flags

relevant case studies

This package should be visible to proposal owner or salesperson preparing the proposal.

42.13 CRM Hygiene SOP During Pilot

CRM Admin / Product Admin Must Monitor

duplicate leads

field mismatch between system and CRM

missing mandatory fields after sync

invalid enum values

assignment mismatches

failed tasks or SLA tags

Rule

CRM should remain the operational record, but Entity Brain should remain the decision layer. Neither should silently overwrite the other without auditability.

42.14 Training SOP for Sales Users

Before pilot start, sales users should be trained on: - what the system is trying to do - what confirmed vs inferred means - how to use next-best question suggestions - when to escalate - how to correct fields - how to avoid bypassing the system - how proposal-readiness differs from general interest

Training Format Recommended

one walkthrough session

one scenario-based practice session

one shadow-mode review session

42.15 Pilot Issue Classification SOP

Every issue raised during pilot should be tagged as one of the following: - Knowledge issue - Scoring issue - Question quality issue - CRM sync issue - UI usability issue - Routing issue - Feasibility logic issue - Training issue - Performance/latency issue

This helps avoid vague statements like “the system is not good” and turns feedback into fixable categories.

42.16 Pilot Success Review SOP

At the end of each pilot cycle, leadership should review: - whether founder dependency reduced - whether discovery quality improved - whether high-priority leads were identified earlier - whether feasibility issues were caught earlier - whether sales adopted the system properly - whether logic is stable enough to expand

Expansion Decision Options

expand to more services

expand to customer-facing discovery bot

continue internal-only tuning

pause and fix specific modules before expansion

42.17 Pilot SOP Checklist

Daily Checklist

new pilot leads entered through system

high-priority leads reviewed

pending escalations addressed

sync failures checked

overrides logged

Weekly Checklist

pilot metrics reviewed

top weak questions reviewed

top overrides reviewed

top feasibility corrections reviewed

logic changes approved or deferred

End-of-Pilot Checklist

baseline vs pilot comparison completed

expansion readiness assessed

v2 improvement backlog created

42.18 Recommended Next Document

After this Pilot Operating SOP, the next most useful document is: Figma Wireframe / Prototype Prompt Pack

That will allow AIM to turn this specification into actual screen concepts quickly for design and build alignment.

43. Figma Wireframe / Prototype Prompt Pack

This section converts the AIM Entity Brain product specification into design-ready prompts.

These prompts are intended for: - Figma AI - a product designer - a UI/UX freelancer - low-code UI prototyping tools - internal frontend teams creating first-pass wireframes

Prompt Pack Objective

Generate usable screen concepts for the first version of AIM Entity Brain with: - clean B2B SaaS layout - premium but functional UI - strong information hierarchy - fast decision support for sales and leadership - minimal clutter during live usage

Design Direction

Use a clean, data-driven, premium interface style aligned to AIM’s broader design language: - white or very light backgrounds - dark navy text - AIM blue accents - rounded cards - subtle shadows -

clean spacing - high readability - clear chips, tags, and status indicators - dashboard-first layout - modern enterprise SaaS feel

Global UX Principles

Sales must understand a lead in under 30 seconds.

The interface must clearly separate confirmed, inferred, and missing information.

Score, confidence, and proposal-readiness must always be visible.

The UI must support live call usage without forcing too much scrolling.

Important actions must be obvious: ask next question, assign, escalate, override, sync, move to proposal.

AI-generated recommendations must always be visually separable from human-confirmed facts.

43.1 Global Design Prompt

Master Prompt

Design a premium B2B SaaS product called AIM Entity Brain, an AI-powered sales intelligence and discovery copilot for a marketing and activation company. The product helps sales teams qualify leads, ask the right next question, score opportunities, recommend services, identify missing information, and route high-priority leads correctly. The UI should feel modern, clean, premium, and data-driven, with white backgrounds, dark navy typography, AIM-blue accents, rounded cards, light borders, subtle shadows, clean chip-based statuses, and strong information hierarchy. The design must support live sales usage, founder review, and CRM-style workflow. Use a desktop-first layout with modular cards, right-side action panels, sticky score/status areas, and clear separation between confirmed data, inferred data, missing data, recommendations, and risk flags.

43.2 Screen Prompt: Lead Intelligence Dashboard

Prompt

Design a desktop web application screen for Lead Intelligence Dashboard inside AIM Entity Brain. This is the main screen used by sales teams to understand a lead quickly.

The page should include: - top header with lead name, company name, source channel, last updated time, assigned owner - prominent status chips for total lead score, confidence, proposal readiness, SLA priority, escalation flag - left column showing company and contact details, designation, industry, service category, sub-service, geography - central section showing requirement summary, target audience, timeline, budget band, campaign objective, preferred touchpoints - a clear Missing Information card showing unresolved critical fields - a Recommended Next Action card with suggested next step and why it matters - a Solution Recommendation card showing recommended service mix, campaign model, budget band, and top assumptions - a Case Studies / Supporting Proof card - right-side sticky sidebar with score breakdown, confidence explanation, proposal readiness, and quick action buttons - bottom activity timeline with recent interactions, sync events, overrides, and discovery milestones

Use a premium enterprise SaaS style, clean sections, rounded cards, subtle blue highlights, and fast scannability. Make the most important commercial information visible above the fold.

Key UI Elements to Include

score donut or score bar for total lead score

chip-style status labels

collapsible cards for long summaries

quick action buttons: Open Discovery Assistant, Assign Owner, Escalate, Sync CRM, Move to Proposal

visually distinct labels for Confirmed / Inferred / Missing

43.3 Screen Prompt: Live Discovery Assistant

Prompt

Design a desktop screen for Live Discovery Assistant in AIM Entity Brain. This is used by a salesperson during a live call or WhatsApp/email clarification flow.

The screen should feel fast, focused, and minimal-clutter.

The page should include: - left panel showing live transcript or conversation notes - center panel showing Next-Best Question card prominently at the top - below it, a list of alternative questions if needed - a structured answer capture area with editable fields - a Field State Tracker showing confirmed fields, inferred fields, missing critical fields, and recently updated fields - a live Score & Confidence Update panel showing how new answers affect qualification - a Proposal Readiness module that updates live - quick actions to mark answer confirmed, edit field, skip question with reason, request founder review, generate summary - a compact reasoning explanation under the next-best question, like “This question is needed to estimate campaign scope and pricing band.”

Use clean cards, sticky top question area, a strong center-column interaction area, and a right-side intelligence sidebar. The interface should help a salesperson move smoothly without losing conversation flow.

Key UI Elements to Include

“Next Best Question” highlighted in blue-accent card

inline tags showing Quote Critical / Feasibility Critical / Scoring Critical

animated or clearly visible score changes after answer capture

distinct boxes for Confirmed, Inferred, Missing

a top-right “Escalate for Review” button

43.4 Screen Prompt: Founder Review Panel

Prompt

Design a premium review interface for Founder Review Panel in AIM Entity Brain. This screen is used by a founder or sales head to review high-value or low-confidence leads.

The screen should include: - top header with lead identity, company, strategic account badge if applicable, escalation reason - top row of score cards for total score, confidence, strategic value, feasibility, proposal readiness - left section with system-generated lead summary, discovery summary, missing information, and conversation highlights - central section with System Recommendation card showing recommended service mix, next step, assumptions, risks, and suggested owner - right section with Override Controls to edit fields, change service classification, change owner, adjust readiness, or mark nurture/disqualify - a before/after comparison view when override is being entered - override reason input box - override history section showing previous changes, timestamps, and who made them - bottom timeline for recent decisions and review actions

Make the interface feel high-trust, executive, and low-noise. Use premium card layouts, score emphasis, and clear visual distinction between system recommendation and human override.

Key UI Elements to Include

escalation banner at top

split view: System Recommendation vs Override

mandatory override reason field

approve, edit, and override buttons

audit timeline

43.5 Screen Prompt: Solution Recommendation Panel

Prompt

Design a focused screen for Solution Recommendation Panel in AIM Entity Brain. This screen helps sales understand what to propose and why.

The page should include: - primary recommendation card with recommended service mix and campaign model - secondary alternatives card showing 1–2 alternative service paths - “Why this fits” section listing the business reasons for recommendation - “Budget & Timeline Guidance” card with suggested bands - “Assumptions” card and “Exclusions / Risks” card - supporting case studies panel with thumbnails or compact cards - quick actions: Accept Recommendation, Send to Proposal Prep, Compare Alternatives, Escalate

The design should feel strategic and commercially intelligent rather than overly technical. Use elegant cards, concise bullets, strong hierarchy, and premium spacing.

Key UI Elements to Include

recommendation confidence chip

info cards for assumptions and exclusions

linked case-study cards

primary CTA button for moving to proposal stage

43.6 Screen Prompt: Knowledge Admin Panel

Prompt

Design an admin console screen for Knowledge Admin Panel in AIM Entity Brain. This panel is used to manage services, industry playbooks, discovery questions, scoring config, case studies, and logic versions.

The page should include: - left navigation for Services, Industries, Questions, Scoring, Case Studies, Versions - main content area showing a table or card list of the selected knowledge object - edit drawer or side panel for updating records - status chips for Active, Draft, Archived, Needs Review - version management controls for publish and rollback - filters for service, industry, status, and owner - a top banner showing current live logic version

The design should feel like a modern internal admin SaaS panel: clean, organized, and efficient.

Key UI Elements to Include

searchable data tables

side-edit panel or modal

publish version button

rollback button

structured field forms

43.7 Screen Prompt: Weekly Pilot Analytics Dashboard

Prompt

Design a desktop analytics dashboard for AIM Entity Brain Pilot Review. This dashboard is used weekly by founder, sales head, and product/admin to assess pilot quality.

The page should include: - KPI cards for leads processed, average completeness score, duplicate question rate, override count, sync failure count, proposal-ready rate - charts for score distribution, confidence distribution, lead status distribution - a panel for top missing fields - a panel for top override categories - a panel for top weak questions or repeated question problems - a panel for conversion by score band - a table of high-risk pilot issues - a weekly action recommendation section

Use a premium analytics UI, clean charts, white background, dark text, restrained AIM-blue accents, rounded metric cards, and highly readable tables.

43.8 Low-Fidelity Wireframe Prompt Pack

Use these prompts when you want simple structural wireframes instead of polished UI.

Low-Fidelity Master Prompt

Create grayscale, low-fidelity wireframes for a B2B SaaS sales intelligence product called AIM Entity Brain. Focus on layout, information hierarchy, and workflow usability rather than visual polish. Use boxes, placeholders, labels, tables, cards, sidebars, tabs, and chips. Show desktop-first screen layouts for lead intelligence, live discovery, founder review, recommendation, and knowledge admin.

Low-Fidelity Screen Prompt: Lead Dashboard

Create a grayscale wireframe for a lead dashboard with a three-column layout: left for lead identity and company info, center for requirement summary and missing info, right for score, confidence, readiness, and action buttons. Include an activity timeline below.

Low-Fidelity Screen Prompt: Live Discovery Assistant

Create a grayscale wireframe for a live discovery screen with left transcript panel, center next-best question and answer capture area, and right field-state tracker with live score changes.

Low-Fidelity Screen Prompt: Founder Review

Create a grayscale wireframe for a founder review screen with escalation banner, summary area, system recommendation panel, override form, and audit timeline.

43.9 Clickable Prototype Flow Prompt

Prompt

Create a clickable prototype for AIM Entity Brain with the following flow: 1. user lands on Lead Intelligence Dashboard 2. clicks Open Discovery Assistant 3. sees next-best question and enters an answer 4. score and readiness update dynamically 5. user returns to dashboard and sees updated summary 6. user opens Solution Recommendation Panel 7. user chooses Escalate for Review 8. founder review screen opens with override controls 9. founder changes service path and submits override 10. dashboard updates with new recommendation and audit entry

The prototype should prioritize business workflow clarity over full UI polish.

43.10 Component Library Prompt

Prompt

Design a component library for AIM Entity Brain using a premium B2B SaaS design system. Include: - status chips - score cards - confidence indicators - summary cards - missing info alerts - field state badges for Confirmed / Inferred / Missing - side panels - activity timeline rows - editable

table rows - recommendation cards - escalation banner - override modal - analytics KPI cards

Use consistent rounded corners, subtle shadows, navy typography, blue accents, clean grids, and high readability.

43.11 UX Copy Guidance for Prototype

Use short, professional labels and helpful assistant-style system text.

Suggested Label Examples

Lead Intelligence

Discovery in Progress

Recommended Next Step

Missing Critical Information

Proposal Readiness

High Intent Priority

Needs Human Review

Confirmed Information

Inferred Information

Escalation Reason

Recommended Service Mix

Why This Fits

Risks & Assumptions

Suggested Helper Text Examples

This question helps determine campaign scope and budget fit.

More information is needed before a scoped proposal can be prepared.

This lead is high-value, but confidence is low due to missing commercial details.

Feasibility should be validated before final commitment.

43.12 Recommended Prototype Build Order

Create design concepts in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel 6. Weekly Pilot Analytics Dashboard

This sequence matches the highest-value usage path for AIM.

43.13 Recommended Next Deliverables

After this prompt pack, the next strongest execution outputs are: 1. a Figma file or clickable prototype 2. an engineering estimation sheet by workstream 3. a knowledge ingestion tracker spreadsheet 4. a pilot-ready issue tracker template

At this point, AIM has enough specification depth to begin design, estimation, and phased build execution.

44. Knowledge Ingestion Operating Model

This section turns knowledge ingestion from a concept into a working operating model for AIM.

The goal is to make sure AIM can continuously convert: - founder knowledge - service know-how - case studies - proposals - SOWs - ops constraints - sales conversations - objections and rebuttals

into structured, versioned, usable Entity Brain knowledge.

Operating Model Principles

Ingestion is a recurring business process, not a one-time upload project.

Every important knowledge item should move through a defined workflow.

Nothing should become live without validation.

Every structured record must retain source provenance.

High-frequency commercial knowledge should be ingested first.

44.1 Knowledge Ingestion Workflow

Stage 1: Capture

Collect raw knowledge from founders, sales, ops, proposals, decks, and transcripts.

Stage 2: Inventory

List and tag the source with metadata.

Stage 3: Extract

Pull out commercially meaningful facts, patterns, conditions, and rules.

Stage 4: Normalize

Convert extracted points into structured entities.

Stage 5: Validate

Get service owner / founder / ops approval.

Stage 6: Publish

Push validated logic into active or draft knowledge version.

Stage 7: Monitor

Track where the ingested knowledge performs well or poorly in live usage.

Stage 8: Refresh

Update or retire stale knowledge.

44.2 Recommended Knowledge Repositories

AIM should maintain four distinct knowledge repositories.

Repository A: Structured Core Knowledge

Stores: - services - sub-services - discovery questions - scoring rules - routing rules - feasibility notes - objections - proposal modules

Repository B: Retrieval Knowledge

Stores: - case studies - decks - SOWs - proposal archives - transcripts - internal playbooks

Repository C: Working Draft Knowledge

Stores: - extracted but unvalidated records - founder interview notes - pending logic proposals - staging-only updates

Repository D: Historical / Archived Knowledge

Stores: - old logic versions - retired services - outdated pricing patterns - historical references

44.3 AIM-Specific Knowledge Domains to Ingest

Domain 1: Commercial Service Knowledge

what AIM sells

where each service fits

where it does not fit

what is required before quote

what is required before feasibility validation

Domain 2: Touchpoint Intelligence

IT parks

RWAs / apartments

malls

retail stores

colleges

gyms

LED vans

hybrid combinations

Domain 3: Industry Intelligence

FMCG

snacks / foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care

Domain 4: Sales Discovery Intelligence

must-ask questions

disqualifying signals

upsell signals

pilot vs rollout signals

budget discovery patterns

Domain 5: Delivery / Ops Intelligence

permissions

lead times

staffing assumptions

fabrication dependencies

city-level constraints

reporting realities

Domain 6: Case Study and Proof Intelligence

what proof to use for which lead

which results matter by category

what kind of case study helps which objection

Domain 7: Objection and Rebuttal Intelligence

budget objections

trust objections

timing objections

attribution objections

feasibility objections

“why this touchpoint” objections

44.4 Knowledge Item Types

Each ingested item should be classified into one of these types.

44.5 Detailed Source Inventory Template

Use this structure for every potential source.

44.6 Extraction Template by Source

When extracting from any source, capture the following.

44.7 Normalization Templates

A. Service Logic Normalization Template

service_name

sub_service_name

description

ideal_use_cases

non_ideal_use_cases

best_fit_industries

best_fit_audiences

mandatory_quote_inputs

mandatory_feasibility_inputs

44.8 Knowledge Validation Workflow

Validation Levels

Level 1: Content Validation

Checks whether the extracted content is understandable and correctly structured. Owner: Product/Admin

Level 2: Commercial Validation

Checks whether the logic matches real sales and founder thinking. Owner: Founder / Sales Head

Level 3: Feasibility Validation

Checks whether the guidance is operationally realistic. Owner: Ops Lead

Level 4: Publication Validation

Checks whether the item is ready for live logic versioning. Owner: Product/Admin + designated approver

Validation Status Options

Draft

Needs Commercial Review

Needs Feasibility Review

Approved for Staging

Approved for Live

Rejected

Archived

44.9 Knowledge Review SLAs

To prevent ingestion backlog from piling up, use practical turnaround targets.

44.10 AIM Knowledge Backlog Structure

AIM should maintain the ingestion backlog in four buckets.

Bucket A: Pilot-Critical Now

Needed before or during pilot.

Bucket B: High-Value Next

Strong value but not needed on day one.

Bucket C: Expansion Later

Useful for broader product scale after pilot stability.

Bucket D: Historical / Research

Useful for reference but not urgent to normalize.

44.11 Recommended AIM Pilot Knowledge Backlog

Bucket A: Pilot-Critical Now

Product Sampling — core definition

IT Park Sampling logic

RWA / Apartment Sampling logic

Mall Sampling logic

In-Store Sampling logic

Brand Activation — kiosk / demo logic

LED Van campaign logic

Top 5 beauty/skincare case studies

Top 5 FMCG/snack/beverage case studies

Top budget objections and responses

Top feasibility blockers by service

Founder scoring/routing signals for high-value leads

Bucket B: High-Value Next

Retail branding

Hybrid campaign solution logic

College sampling expansion

Gym / fitness outreach expansion

Menstrual hygiene campaign nuances

Pet care targeting logic

Additional case study tagging

Bucket C: Expansion Later

voice-call transcript intelligence

email thread mining

long-term win/loss patterns

advanced proposal-block recommendations

Bucket D: Historical / Research

old proposals with outdated pricing

one-off client exception SOWs

historical services no longer central to AIM

44.12 AIM First 25 Knowledge Tasks

Below is a practical starter backlog.

44.13 Founder Interview Pack for Ingestion

Use this structured format when capturing founder knowledge.

Founder Interview Questions by Service

When is this service the best fit?

When is this service a weak fit?

What are the first three questions you ask?

What information must you know before quoting?

What makes you cautious about this type of lead?

What signals tell you the lead is serious?

What common mistakes do salespeople make with this service?

What objections come up most often?

What is the best fallback or pilot option when scope is unclear?

Which case study do you usually reference and why?

Output from Each Interview

service rules

discovery questions

scoring signals

objection-response pairs

case study mapping

feasibility warnings

44.14 Sales Debrief Capture Format

Sales users should log structured insights after important calls.

Capture Fields

lead_id

service discussed

what questions worked well

where the prospect got confused

what objection came up

what information was hard to get

what the system got right

what the system got wrong

whether founder help was needed

recommendation for logic update

This is one of the best sources for real-world ingestion improvement.

44.15 Ops Debrief Capture Format

Ops should contribute not only when something fails, but as a proactive ingestion source.

Capture Fields

service / touchpoint

what feasibility assumption was unrealistic

what information sales missed

what timeline assumptions were wrong

what permission dependency was critical

what product handling concern existed

what future question should be asked earlier

44.16 Knowledge Freshness and Retirement Rules

A knowledge item should be marked “Needs Review” when:

pricing drivers change materially

permissions reality changes

a service definition changes

repeated overrides challenge the same rule

a case study becomes outdated or less relevant

A knowledge item should be archived when:

service is no longer actively sold

case study is no longer commercially useful

logic is replaced by a better version

pricing assumptions are obsolete and misleading

44.17 Knowledge Quality Scorecard

Each ingested knowledge item can be rated before publication.

Suggested Publication Rule

Only items with acceptable ratings across all core dimensions should move live.

44.18 Knowledge Ingestion Cadence Recommendation

Daily

capture new important insights from sales and ops

tag new useful source materials

Weekly

normalize priority items

review overrides and convert them into candidate logic updates

publish approved micro-updates if safe

Monthly

review service logic freshness

review question-bank effectiveness

archive stale knowledge

refresh case study relevance

44.19 Knowledge Ops Ownership Model

If AIM wants this system to stay strong, one person should effectively own knowledge operations.

Recommended Knowledge Ops Owner Responsibilities

maintain source inventory

coordinate extraction and normalization

chase reviews and approvals

ensure freshness and archive stale logic

prepare weekly knowledge update recommendations

track ingestion throughput and bottlenecks

This role can initially be handled by Product/Admin.

44.20 Recommended First Working Session Agenda

For AIM’s first hands-on knowledge ingestion workshop, run this agenda:

Session 1: Product Sampling Core (90–120 min)

define Product Sampling v1

define IT Park, RWA, Mall, In-Store variants

list quote-critical inputs by variant

list feasibility-critical inputs by variant

list top objections by variant

list strongest case studies by variant

approve draft discovery questions

Session 2: Activation + LED Van (60–90 min)

define kiosk activation logic

define product demo logic

define LED van logic

list misfit cases

approve scoring cues and escalation signals

Session 3: Industry Plays (60–90 min)

beauty/skincare

FMCG/snacks/beverages

wellness

baby care / menstrual hygiene where relevant

44.21 Recommended Next Output

The best practical next artifact after this operating model is: a Knowledge Ingestion Tracker with columns, statuses, owners, and the first AIM backlog pre-filled

That will convert this plan into an actual working tool for the team.

45. Service-by-Service Ingestion Pack

This section provides the actual ingestion packs AIM can use service by service.

Each pack is designed to help AIM move from raw founder knowledge and past documents into: - structured service records - discovery question banks - feasibility notes - objection-response pairs - case-study tags - proposal modules - scoring signals

How to Use This Section

For each service pack: 1. review the service definition internally 2. gather the recommended source materials 3. run founder / sales / ops capture session 4. normalize outputs into structured records 5. validate the pack before publishing it into the live knowledge version

Standard Pack Structure

Each service pack includes: - service purpose - what the Entity Brain must know - source materials to collect - founder capture prompts - sales capture prompts - ops capture prompts - structured entities to create - validation checklist - publication readiness checklist

45.1 Pack 1 — Product Sampling (Core)

Service Purpose

This is the parent commercial service. It defines AIM’s overall product sampling capability, where trial-based brand outreach is used to drive awareness, first use, consideration, and in some cases conversion or measurable response.

What the Entity Brain Must Know

what product sampling means in AIM’s context

what business objectives product sampling solves

which industries are best suited

which touchpoints are available under product sampling

where sampling is a weak fit

what must be known before quoting

what must be known before confirming feasibility

what proof/case studies to show by industry or touchpoint

Recommended Source Materials

AIM sampling service decks

founder explanations of sampling model

past sampling proposals and SOWs

sample budgets or cost breakups

case studies from beauty, FMCG, wellness, beverage, baby care, etc.

past client requirement notes

WhatsApp/email threads where sampling approach was explained

Founder Capture Prompts

In AIM terms, what exactly counts as product sampling and what does not?

When do you immediately know sampling is the right recommendation?

When do you avoid recommending sampling?

What are the top 5 questions you ask first?

What do you need before giving even a budgetary estimate?

Which touchpoints do you mentally shortlist first by category?

What makes a product sampling brief weak or risky?

What kind of client expectation usually creates trouble later?

Sales Capture Prompts

What type of brands ask for sampling most often?

What information do prospects most often fail to provide?

Which objections come up early most often?

What questions usually open up a better conversation?

Where do you most often need founder help today?

Ops Capture Prompts

What are the most common feasibility blockers in sampling?

Which handling or permission issues are often missed by sales?

What lead-time assumptions are most often unrealistic?

What reporting expectations should be carefully managed?

Structured Entities to Create

Product Sampling service record

parent discovery question set

universal quote-critical input set

universal feasibility-critical input set

universal sampling objections set

universal sampling scoring cues

touchpoint decision matrix

case-study map by industry and objective

Validation Checklist

service definition is clear and non-generic

best-fit industries are captured

clear misfit logic exists

all child touchpoints are referenced consistently

quote-critical inputs are complete but not excessive

feasibility notes reflect real delivery constraints

Publication Readiness Checklist

parent service record approved

universal sampling question bank approved

top 3 case studies tagged

pilot scoring cues approved

founder escalation signals approved

45.2 Pack 2 — IT Park Sampling

Service Purpose

Sampling executed in office parks, tech parks, or workplace clusters to reach working professionals and employee audiences.

What the Entity Brain Must Know

who this touchpoint is best for

when IT parks outperform malls or RWAs

premium vs volume-focused park choices

kiosk vs promoter-led distribution options

branding dependencies

employee audience fit by category

permission and access realities

Ideal Use Cases

beauty / skincare targeting working professionals

beverages and wellness products for office-going consumers

premium FMCG trial among salaried urban audience

product education in controlled weekday environments

Common Misfit Cases

products with no working-professional relevance

very low sample quantity requests where park access effort is too high

brands demanding very broad general household reach

extremely urgent campaigns with no time for park approvals/access coordination

Recommended Source Materials

past IT park proposals

lists of past venue types or corporate parks used

photos / proof of previous activations

staffing notes

permission notes and timelines

case studies with office-going TG

Founder Capture Prompts

When do you choose IT parks over malls or apartments?

What kind of products work best here?

How do you distinguish premium parks vs high-volume parks?

What does the client need to clarify before pricing is meaningful?

What usually gets underestimated in this touchpoint?

Sales Capture Prompts

What target-audience descriptions signal a strong IT park fit?

What questions help reveal whether the client wants interaction or only distribution?

What confusion do prospects typically have about office park access or quality of audience?

Ops Capture Prompts

How much lead time is typically needed?

What permissions or coordination models commonly apply?

What branding / setup limitations exist on site?

What manpower assumptions are realistic?

Structured Entities to Create

IT Park Sampling sub-service record

quote-critical question set

feasibility note set

premium-vs-volume venue assumptions guide

objections specific to workplace outreach

beauty/wellness/FMCG case-study tag group

Validation Checklist

working-professional TG logic is explicit

premium / scale differentiation is captured

permission model is described accurately

site setup options are clearly defined

Publication Readiness Checklist

one premium audience case study tagged

one volume-focused case study tagged

founder-approved must-ask questions loaded

feasibility notes validated by ops

45.3 Pack 3 — RWA / Apartment Sampling

Service Purpose

Sampling conducted in residential communities, apartment complexes, or gated societies to reach households and family decision-makers.

What the Entity Brain Must Know

which household-oriented categories fit best

how to distinguish premium apartments vs broad family communities

gate activity vs kiosk vs deeper engagement formats

society permissions reality

household decision-maker targeting logic

where residential outreach is a poor fit

Ideal Use Cases

baby care

household FMCG

family-use personal care products

food trial for family or community consumption

products where homemakers / parents / households matter

Common Misfit Cases

youth-only products with weak household relevance

categories better suited to workplace or college contexts

campaigns with no tolerance for society approvals or timing limits

premium niche categories that need a more controlled aspirational environment

Recommended Source Materials

apartment activation proposals

pricing sheets by society count or manpower model

permission notes

earlier residential campaign proofs

community-wise targeting notes if available

Founder Capture Prompts

What are the strongest buying situations for RWA sampling?

What signals tell you a client actually needs residential reach rather than mall or retail reach?

What are the first three things you ask about scale and society profile?

When do you reject or redirect the lead?

Sales Capture Prompts

What do prospects usually misunderstand about RWA execution?

What info is usually missing when they ask for pricing?

Which objections or hesitations come up most often?

Ops Capture Prompts

What permission models differ across apartments?

What timing rules or society restrictions are common?

What staffing assumptions or transport considerations matter?

Structured Entities to Create

RWA / Apartment Sampling sub-service record

society-type segmentation notes

quote-critical questions by residential model

permission dependency notes

household-relevance scoring cues

objections around permissions / community access / value perception

Validation Checklist

household TG logic is strong

premium vs broad-community distinction is captured

permission issues are realistic

scale planning logic is usable for quoting

Publication Readiness Checklist

at least 2 residential campaign examples tagged

key objections and responses approved

risk notes validated by ops

45.4 Pack 4 — Mall Sampling / Mall Activation

Service Purpose

Sampling or trial activity inside malls or public premium venues, often supported by kiosk, promoter interaction, or branded setup.

What the Entity Brain Must Know

when mall activation is worth recommending

premium-mall vs high-footfall-mall logic

kiosk vs promoter-only formats

branding/fabrication impact on cost and feasibility

demo-led vs handout-led differences

weekend vs weekday considerations

Ideal Use Cases

beauty / skincare

premium personal care

beverage, food, and new launches needing mass trial

products benefitting from visible public engagement

brands wanting premium perception plus reach

Common Misfit Cases

very low budgets for premium venues

products with no shopper interaction value

client not ready for branding/fabrication cost implications

B2B products with poor consumer venue relevance

Recommended Source Materials

mall activation proposals

fabrication cost sheets

mall permission notes

staffing models

photos and case studies

existing premium-vs-footfall venue notes

Founder Capture Prompts

When do you recommend mall before IT park or retail?

How do you distinguish premium need vs simple volume need?

What is the minimum information needed before pricing?

When do branding requirements materially change the solution?

Sales Capture Prompts

What do prospects usually ask first about malls?

What do they misunderstand about cost drivers?

Which questions help uncover whether a kiosk is really needed?

Ops Capture Prompts

What permissions, setup, or power needs matter most?

What fabrication turnarounds are realistic?

What site constraints affect demo-led activity?

Structured Entities to Create

Mall Sampling / Activation sub-service record

venue-tier logic notes

kiosk-vs-promoter scope rules

branding/fabrication cost driver notes

weekend/weekday planning assumptions

mall-specific objections and responses

Validation Checklist

venue tier logic is explicit

cost drivers are accurately captured

kiosk vs promoter-only differentiation is clear

demo/compliance concerns are noted where relevant

Publication Readiness Checklist

one premium mall case study tagged

one broad-footfall mall example tagged

fabrication notes validated by ops

45.5 Pack 5 — In-Store / Retail Sampling

Service Purpose

Sampling or product trial executed inside retail stores to influence shopper conversion, product education, and sell-out.

What the Entity Brain Must Know

when in-store is stronger than mall or residential

retailer / chain approval dependence

store count and chain specifics as cost drivers

demo / educate / distribute staffing differences

shelf / in-store conversion use case

store-level reporting expectations

Ideal Use Cases

launch support in modern trade or chain stores

sell-out push

shopper education for new or unfamiliar products

categories where point-of-purchase trial matters strongly

Common Misfit Cases

no retailer tie-up or unclear store access

no list of stores or chain context

client expects instant conversion attribution without retail control

extremely low store count with disproportionate approval effort

Recommended Source Materials

retail sampling proposals

store-level campaign reports

retailer-specific notes if available

approval dependencies

promoter training notes

case studies from retail chain activations

Founder Capture Prompts

When is in-store the right answer instead of mall or IT parks?

What do you need to know before even giving an initial estimate?

How do you judge whether the client has real retail access?

What kinds of products benefit most from in-store demo or education?

Sales Capture Prompts

What questions reveal whether retailer approval is real or assumed?

What common confusion exists between in-store branding and in-store sampling?

What are the most common client goals here: sell-out, awareness, education?

Ops Capture Prompts

What data is required from stores before execution?

What installation/demo rules matter on ground?

How do staffing/training assumptions change by category?

Structured Entities to Create

In-Store / Retail Sampling sub-service record

retailer approval logic notes

quote-critical question set by chain/store scenario

training-level / promoter-role notes

store-count pricing drivers

retail-specific objections and proof assets

Validation Checklist

store access dependency is explicit

conversion vs education objective split is clear

retailer-approval logic is realistic

staffing differences are captured

Publication Readiness Checklist

one retail-chain case study tagged

store/chain logic validated by sales and ops

must-ask questions approved

45.6 Pack 6 — Kiosk-Based Brand Activation / Product Demo Booth

Service Purpose

Interactive branded activation designed to attract attention, engage audiences, demonstrate the product, and support trial or education.

What the Entity Brain Must Know

when simple sampling should become a fuller activation

kiosk vs light branded setup vs promoter-only model

demo-led vs gamified vs engagement-led activation

branding/fabrication requirements

staff/training expectations

venue-space and power requirements

Ideal Use Cases

product launches needing interaction

categories requiring demonstration or education

premium public or retail environments

campaigns aiming for stronger recall than handout-only distribution

Common Misfit Cases

clients wanting only passive visibility with no interaction

no tolerance for fabrication or branding budget

very small-scale brief where a kiosk is overkill

categories with heavy demo/compliance restrictions not yet thought through

Recommended Source Materials

kiosk activation proposals

demo booth budgets

fabrication vendor templates

staff role descriptions

game / engagement format notes

execution photos and case studies

Founder Capture Prompts

What makes you move from sampling to activation?

What signs tell you the client needs engagement, not just distribution?

What are the most common activation formats AIM should standardize?

When does the kiosk become too heavy or unnecessary for the brief?

Sales Capture Prompts

What client words or goals signal this is really an activation brief?

What discovery questions help uncover branding or engagement expectations?

Which client misunderstandings about cost and complexity are most common?

Ops Capture Prompts

What setup requirements matter most on site?

What dependencies exist around fabrication, power, storage, transport, staff training?

What kind of lead times are realistic by venue type?

Structured Entities to Create

Kiosk Activation sub-service record

demo / gamification / education decision notes

branding/fabrication module rules

venue dependency notes

activation-specific objections and responses

proposal modules for kiosk scope variants

Validation Checklist

activation-vs-sampling distinction is clear

heavier-scope dependencies are captured

staffing and training assumptions are usable

venue dependency notes are grounded

Publication Readiness Checklist

at least 2 activation case studies tagged

fabrication module logic approved

ops risk notes reviewed

45.7 Pack 7 — LED Van / Mobile Outreach

Service Purpose

Vehicle-led mobile visibility or route-based campaign used for awareness, launch buzz, route coverage, or branch/hotspot-based exposure.

What the Entity Brain Must Know

when LED van solves the client’s objective and when it does not

route-based awareness logic

duration, city, and vehicle-type cost drivers

permissions and operating-hour realities

route planning needs

whether client wants visibility only or additional support like audio/promoter/branding

Ideal Use Cases

city-wide visibility bursts

launch buzz

route-specific awareness around branches, hotspots, events, or neighborhoods

quick reach-focused campaigns where awareness is the main job

Common Misfit Cases

clients expecting direct measurable conversion without support layers

no clarity on route, city, or duration

unrealistic immediate deployment when vehicle availability is constrained

clients needing deep interaction instead of visibility

Recommended Source Materials

LED van proposals

city-wise rate cards or budgets

route planning notes

vehicle availability notes

permission notes

photos / video proofs

Founder Capture Prompts

When do you recommend LED van over static media or on-ground activation?

What are the main commercial drivers for pricing and recommendation?

What is commonly misunderstood by clients about this format?

When should the lead be re-scoped because expectation is wrong?

Sales Capture Prompts

Which questions expose whether the client wants awareness or performance?

What do clients often fail to provide about routes, days, and city needs?

What objections usually come up around cost or utility?

Ops Capture Prompts

What availability and permission realities differ by city?

What are the standard operating assumptions around kilometers, hours, driver, fuel, tolls?

What lead-time caveats matter most?

Structured Entities to Create

LED Van / Mobile Outreach sub-service record

city / duration / route cost driver set

awareness-fit scoring cues

expectation-mismatch objection library

route planning note set

ops assumptions record by city where possible

Validation Checklist

route/visibility logic is clear

performance-vs-awareness expectation issue is captured

city-specific feasibility notes exist where possible

standard operating assumptions are explicit

Publication Readiness Checklist

at least 1 Bangalore and 1 Hyderabad example or note set if available

cost-driver structure approved

sales must-ask questions approved

45.8 Cross-Pack Standard Output Checklist

For every service pack before publication, AIM should have these minimum outputs: - 1 approved service record - 1 approved discovery question set - 1 approved quote-critical input list - 1 approved feasibility-critical input list - 1 approved risk / constraint note set - 1 approved objections-and-response set - 1 approved scoring cue set - at least 1 case study tagged, ideally 2+ - founder reviewer sign-off - ops sign-off if execution-sensitive

45.9 Cross-Pack Working Session Format

Session Format per Service

Duration: 45–75 minutes per service pack

Suggested Agenda

define the service in AIM terms

identify best-fit vs weak-fit use cases

finalize mandatory discovery questions

finalize quote-critical fields

finalize feasibility-critical fields

capture common objections

shortlist proof/case studies

note the top risk patterns

define escalation situations

approve draft structured records

45.10 Recommended Working Sequence for AIM

Use this order for the first ingestion cycle: 1. Product Sampling (Core) 2. IT Park Sampling 3. RWA / Apartment Sampling 4. Mall Sampling 5. In-Store / Retail Sampling 6. Kiosk Activation 7. LED Van / Mobile Outreach

This sequence matches the highest-value pilot logic already defined.

45.11 Recommended Next Artifact

After this service-by-service pack, the best next artifact is: a filled Knowledge Ingestion Tracker with these service packs broken into actionable rows, owners, and due dates

That will let AIM immediately begin execution service by service.

46. Filled Service-Record Pack — Product Sampling (Core)

This section provides the first fully filled service-record pack for AIM Entity Brain.

It is written in a format that can be directly used by: - Product/Admin during ingestion - founders during validation - engineering while shaping the knowledge schema - sales while understanding what the system should know

This is the parent service record for Product Sampling. Sub-services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

46.1 Service Record Header

46.2 Service Definition

Working Definition

Product Sampling is AIM’s controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

46.3 Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following: - product trial - awareness through physical experience - new product launch support - target-group-specific introduction - category education - sell-out assistance in supported environments - feedback collection after trial - trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

46.4 Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

46.5 Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

46.6 Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

46.7 Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

46.8 Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known: - product category - target audience - geography - timeline band - sample volume or scale band - preferred touchpoint or touchpoint recommendation path - campaign model (pilot / rollout) - budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

46.9 Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following: - permission dependency by chosen touchpoint - product handling requirements - temperature / tasting / demo constraints if any - timeline realism - promoter/staffing need - branding/setup scope if applicable - city-level ops availability - reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

46.10 Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by: - touchpoint type - city and geography spread - sample volume - campaign duration - promoter/manpower need - setup / kiosk / branding requirement - permissions dependency - reporting complexity - handling complexity of sample product - campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

46.11 Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

46.12 Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

46.13 Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say: - “Product Sampling is a strong parent fit.” - then recommend child path(s) with reason - then show assumptions and missing inputs before final scoping

46.14 Risk Flags

The system should explicitly warn when: - product category and venue appear mismatched - target audience is too broad for current scope - timeline may not support permissions or setup - scale is too low for chosen touchpoint economics - attribution expectations exceed planned campaign design - sample handling requirements are still unclear

46.15 Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by: - industry - objective - touchpoint - geography - audience type - scale band - reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

46.17 Validation Checklist — Filled

46.18 Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following: 1. founder review and wording approval 2. sales-head review of objections and discovery questions 3. ops validation of feasibility risks and handling constraints 4. case-study mapping for at least 3 strong parent references 5. confirmation of child-service inheritance model in knowledge schema 6. approval of parent scoring cues and escalation triggers

46.19 Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is: IT Park Sampling

Reason: - it is one of AIM’s highest-value sampling variants - it frequently needs nuanced founder judgment - it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM’s targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

19. Suggested JSON Shape

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Cross-Industry Recommendation Rules + Industry-to-Service Ranking Matrix

1. Document Purpose

This document defines the cross-industry recommendation layer for AIM Entity Brain.

Its purpose is to help the system answer one of the most important commercial questions consistently:

Given the industry, objective, audience, budget, timeline, and context, which AIM service should be recommended first, which should be recommended second, and which should be avoided?

This document is meant to sit above:

individual service records

individual industry playbooks

It acts as the decision bridge between them.

2. Why This Layer Matters

If the Entity Brain only knows:

what each service is, and

what each industry generally prefers,

that is still not enough.

It must also know:

when to prioritize precision over scale

when to prioritize trust over reach

when to prioritize conversion context over visibility

when to recommend pilot-first instead of rollout-first

when one service is the primary fit and another is only a secondary option

Without this layer, the system may produce flat recommendations instead of founder-like recommendations.

3. Recommendation Design Principles

Industry fit alone is not enough. Objective and audience context must refine the choice.

Service ranking should be conditional, not absolute.

Primary recommendation should solve the main business job.

Secondary recommendation should exist only if it meaningfully improves fit.

The system should clearly separate core fit from optional expansion paths.

Misfit logic should suppress attractive-but-wrong options.

If the environment can damage brand fit, that should override scale temptation.

4. Recommendation Output Model

For any qualified lead, the system should produce:

4.1 Primary Recommendation

The best current commercial path.

4.2 Secondary Recommendation

A viable alternative if:

budget is different

timeline is different

client preference shifts

feasibility weakens for the primary path

4.3 Optional Expansion Path

Only shown when:

hybrid campaign makes sense

phased rollout is sensible

a pilot-first followed by scale path is commercially strong

4.4 Suppressed Options

The system should internally mark low-fit options as:

weak fit

avoid unless client insists

misfit

5. Cross-Industry Service Ranking Scale

Use the following recommendation strength labels.

6. AIM Service Set Used in This Matrix

The matrix uses the following service options:

IT Park Sampling

RWA / Apartment Sampling

Mall Sampling / Mall Activation

In-Store / Retail Sampling

College / Campus Sampling

Gym / Fitness Sampling

Kiosk-Based Brand Activation / Product Demo Booth

LED Van / Mobile Outreach

Hybrid Campaign Solution

7. Industry-to-Service Ranking Matrix

7.1 Beauty / Skincare

Default Recommendation Bias

prioritize audience quality over raw trial volume

suppress low-context mass distribution for premium briefs

7.2 FMCG / Snacks / Beverages

Default Recommendation Bias

prioritize usage-context fit + scalable reach

handling/logistics can promote or demote a touchpoint sharply

7.3 Wellness / Nutrition

Default Recommendation Bias

prioritize credibility of environment and affinity of audience

only scale after context fit is established

7.4 Baby Care

Default Recommendation Bias

prioritize trust-first environments over pure reach

suppress loud, generic, or low-relevance public distribution

7.5 Menstrual Hygiene

Default Recommendation Bias

prioritize comfort, relevance, and education fit over broad reach

suppress any touchpoint likely to create awkward engagement dynamics

7.6 Pet Care

Default Recommendation Bias

prioritize actual pet-owner density over general reach

avoid broad non-owner distribution

8. Cross-Industry Meta Rules

8.1 Objective-to-Service Rules

If the primary objective is Product Trial

Bias toward:

Product Sampling environments first

then activation only if explanation/experience is necessary

If the primary objective is Education

Bias toward:

Kiosk-Based Activation / Demo Booth

In-Store / Retail Sampling

guided workplace / campus / controlled environments

If the primary objective is Sell-Out Support

Bias toward:

In-Store / Retail Sampling first

then supporting awareness or trial formats second

If the primary objective is Premium Visibility + Trial

Bias toward:

Mall Sampling / Mall Activation

Kiosk-Based Activation

then IT Park if premium audience precision matters more than public visibility

If the primary objective is Awareness / Launch Buzz

Bias toward:

Mall/public visibility

LED Van / Mobile Outreach

activation formats

sampling only if trial is part of the actual objective

8.2 Audience-to-Service Rules

Working Professionals

Prefer:

IT Park Sampling

IT Park + selective premium mall hybrid

workplace-led activation

Households / Parents / Family Consumers

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

selective family-footfall mall activation

Shoppers Near Purchase Context

Prefer:

In-Store / Retail Sampling

retail + demo activation

mall only if purchase-context access is weak but trial still valuable

Students / Youth

Prefer:

College / Campus Sampling

college + activation hybrid

mall only if youth public context is more commercially relevant than campus

Fitness / Wellness Users

Prefer:

Gym / Fitness Sampling

Gym + workplace hybrid

premium mall/public demo only if visibility matters alongside trial

Premium Public Audience

Prefer:

Mall Sampling / Mall Activation

Kiosk-Based Activation

selective IT Park if public visibility is less important than audience quality

8.3 Environment-Sensitivity Rules

High Environment Sensitivity Categories

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

premium Pet Care

Rule

For these categories, environment fit should carry extra recommendation weight.

The system should demote any touchpoint that is operationally possible but brand-wise weak.

8.4 Trust-Sensitivity Rules

High Trust-Sensitivity Categories

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule

When trust sensitivity is high:

prefer controlled, relevant environments

prefer trained promoter / guided interaction where appropriate

suppress low-context scale-first paths unless the brand explicitly prefers them

8.5 Scale-First vs Precision-First Rules

Default Precision-First Industries

Beauty / Skincare

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

Default Scale-First Industries

FMCG / Snacks / Beverages

Rule

If a scale-first industry has specialized handling or a niche audience, temporarily treat it like a precision-first brief.

If a precision-first industry has broader mass orientation and low environment sensitivity, allow controlled scale expansion.

9. Recommendation Tie-Breaker Rules

When two services look viable, use this tie-breaker order:

Audience relevance

Environment credibility / brand fit

Objective fit

Feasibility realism

Budget alignment

Case-study support availability

Speed to deploy

Example

If both Mall Sampling and IT Park Sampling are viable for a premium skincare brand targeting women professionals:

choose IT Park first if audience precision matters more

choose Mall first if public brand visibility is equally important

10. Pilot-First Recommendation Rules

The system should recommend pilot-first when:

the client is exploring a new touchpoint

the category is premium or trust-sensitive

audience quality matters more than raw volume

the brief is strategically important but still unclear

the product has handling or explanation complexity

the client wants measurable proof before scale

Pilot-First Output Language

“A pilot-first approach may be appropriate before broader rollout.”

“We recommend validating audience response in one city / one touchpoint first.”

“This touchpoint looks promising, but a controlled phase 1 will likely improve learning and reduce waste.”

11. Hybrid Campaign Recommendation Rules

The system should recommend Hybrid Campaign Solution only when one of the following is true:

the brief genuinely spans multiple distinct audiences

the objective requires both trial and visibility

the brand wants phased testing across environments

one touchpoint solves awareness while another solves conversion/trial

Good Hybrid Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid campaigns just to sound strategic. Recommend them only when they improve commercial fit materially.

12. Suppression Rules

The system should suppress or demote services when:

audience fit is weak

the environment can damage brand perception

permissions or access make the path unrealistic for the timeline

the budget makes the recommendation commercially misleading

the service solves a secondary objective but not the primary one

the recommendation depends on assumptions not yet acceptable for proposal stage

13. Ranking Matrix by Objective Pattern

13.1 Trial at Scale

13.2 Premium Targeted Trial

13.3 Education + Trial

13.4 Sell-Out Support

13.5 Awareness / Launch Buzz

14. Recommended Engine Logic Flow

When generating recommendations, the engine should apply this sequence:

classify industry

classify probable objective

classify target audience

classify environment sensitivity

classify trust sensitivity

classify scale-first vs precision-first need

retrieve ranked service candidates for that industry

rerank candidates based on objective and audience

suppress services failing misfit rules

promote pilot-first or hybrid path if conditions are met

generate primary, secondary, and optional expansion recommendation

15. Suggested Recommendation Output JSON

16. Validation Checklist

17. Publication Readiness Checklist — Pending Actions

Before this matrix goes live, AIM should complete the following:

founder review of all primary ranking assumptions

sales-head validation using 15–20 real past leads

ops validation where service feasibility can materially rerank choices

connect each ranked service to actual service-record logic IDs

test tie-breaker behavior across ambiguous multi-service leads

define admin-editable ranking override rules where necessary

18. Recommended Immediate Next Artifact

After this cross-industry recommendation matrix, the strongest next artifact is:

Industry-to-Service Decision Tree + Scenario Test Library

Reason:

the matrix defines the rules

the next step is to test those rules on real lead scenarios

this will help AIM catch wrong defaults before the engine goes live

AIM Beauty / Skincare — Industry Playbook

1. Document Purpose

This document contains the standalone Industry Playbook for Beauty / Skincare within the AIM Entity Brain knowledge-ingestion framework.

It is designed to help AIM capture how Beauty / Skincare brands think, buy, evaluate sampling/activation channels, and what commercial logic the Entity Brain should use when qualifying or recommending solutions.

This playbook should support:

discovery quality

service recommendation quality

pitch-angle selection

objection handling

scoring accuracy

case-study matching

founder-like commercial reasoning for beauty and skincare briefs

2. Industry Definition

Working Definition

Beauty / Skincare in the AIM context includes brands and product lines focused on:

facial skincare

body care

premium skincare

derma / active skincare

personal grooming products with skincare adjacency

cosmetic-skincare crossover products

self-care products where trial, routine fit, trust, and product education matter

Industry Characteristics

This category is usually:

highly target-group sensitive

perception-sensitive

environment-sensitive

trust-sensitive

trial-friendly when the right audience and context are chosen

often premium or semi-premium in positioning

Important Commercial Truth

For Beauty / Skincare, where the trial happens matters almost as much as how the trial happens.

The wrong environment can reduce brand fit even if the execution is operationally correct.

3. What the Entity Brain Must Know

The Entity Brain should understand the following about Beauty / Skincare briefs:

premium perception matters

environment quality affects response quality

target-group precision is usually more important than raw distribution scale

guided education can matter more than simple handout for some products

female-focused or premium-working-professional segments are often key

product trial can be powerful, but only when the setting aligns with product identity and target audience

brands may care about feedback, repeat usage intent, and trial quality more than just quantity

some subcategories need sensitivity around claims, skin type relevance, and demonstration tone

4. Buyer and Stakeholder Logic

Common Buyer Personas

Brand Manager

Marketing Manager

Category Manager

Founder / Co-Founder (especially D2C)

CMO / Marketing Head

Trade Marketing Manager

Growth / Performance-marketing influenced brand teams in D2C setups

Stakeholder Concerns

Beauty / Skincare decision-makers often care about:

relevance of target audience

premium fit of touchpoint

product education quality

perception risk

brand-image consistency

measurable post-trial signals

whether the activation feels “on-brand”

whether the environment attracts the right women / professionals / shoppers

Typical Internal Decision Dynamics

brand team may want premium fit and perception

trade team may want conversion or store movement

founder may want efficient pilot validation before scale

performance/growth stakeholders may ask about attribution or measurable response

5. Typical Business Objectives

Strongest Objectives in This Industry

product trial

premium target-group introduction

launch awareness

category education

guided trial for unfamiliar formulation/product

feedback capture after first use

targeted sampling to women professionals / premium shoppers / high-affinity segments

Secondary Objectives

lead capture for remarketing

QR / coupon-linked follow-up

retail conversion support

premium brand visibility

Weak / Misaligned Objectives

broad mass distribution with no target-group logic

low-quality reach for premium skincare brief

ultra-transactional performance expectation from touchpoint with no measurement design

aggressive sell-out expectation from a brand-awareness-only activity

6. Target Audience Logic

For Beauty / Skincare, the Entity Brain should push for greater audience clarity than in many FMCG categories.

Key Audience Dimensions to Capture

women / men / unisex relevance

age band

life stage

premium vs mass orientation

working professionals vs homemakers vs students

skin concern or category relevance if applicable

urban premium vs broad-market audience

purchase behavior: exploratory, routine, premium, problem-solution driven

High-Value Audience Patterns

women professionals in urban offices

premium mall shoppers

premium apartment communities

skincare-aware D2C shopper segments

wellness-oriented premium consumers

pharmacy / modern trade beauty buyers where education matters

Lower-Quality Audience Situations

broad unfiltered general crowd for premium skincare launch

environments that do not support brand identity or product explanation

settings where the trial audience is unlikely to be the buyer

7. Service Fit Logic for Beauty / Skincare

Strongest Service Fits

IT Park Sampling

Best when:

target is women professionals or urban working consumers

brand positioning is premium or aspirational

weekday high-quality audience matters

guided product introduction can be done efficiently

Mall Sampling / Mall Activation

Best when:

premium public visibility matters

the product benefits from visible trial and brand presence

the category needs aspirational retail/public context

kiosk or guided setup improves the experience

In-Store / Retail Sampling

Best when:

product education at point of purchase matters

retail conversion support is important

the brand is present in relevant modern trade or beauty retail environments

shopper hesitation can be reduced by in-store demo or explanation

Kiosk-Based Brand Activation / Demo Booth

Best when:

category education matters

the brand wants visual presence plus guided experience

the product requires more explanation than a simple sample handout

RWA / Apartment Sampling

Best when:

the product is highly relevant to women / families in premium communities

the objective is household-level trust and targeted community introduction

community context is a better fit than public venue

Moderate Service Fits

gym / studio outreach for skincare-wellness crossover or premium self-care angle

hybrid campaigns combining IT park + mall or mall + retail for layered objective

Weak / Misfit Service Fits

low-context mass distribution for premium skincare

youth-heavy campus-first campaigns unless the product truly fits that audience and brand tone

visibility-only mobile outreach unless part of a broader launch layer

8. Premium-Fit vs Mass-Fit Logic

Beauty / Skincare often requires the brain to reason about quality of audience and environment, not just volume.

Premium-Fit Signals

premium or semi-premium price point

founder/brand team emphasizes brand perception

product has routine or care-value rather than impulse-only nature

explanation, guided trial, or aspirational association matters

target audience is urban professional or premium shopper segment

Mass-Fit Signals

accessible price point with broad consumer relevance

trial at scale matters more than premium setting

product is simple enough for broader distribution environments

awareness is more important than elevated perception

Rule

If the brand is premium or skincare-education-led, the system should usually prefer audience-quality-first recommendations over mass-volume-first recommendations.

9. Discovery Question Bank — Beauty / Skincare Specific

These questions should be layered on top of service-specific discovery.

10. Quote-Critical Inputs for Beauty / Skincare

Before giving strong commercial direction in this industry, the system should try to know:

product category / SKU type

premium vs mass orientation

target user segment

environment preference or sensitivity

objective (trial / launch / education / retail support)

city or cities

scale or sample volume

engagement depth needed

budget band or budget openness

Minimum for Strong Recommendation

target user clear

product positioning clear

objective clear

city clear

probable touchpoint fit clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

engagement depth roughly known

environment quality preference roughly known

11. Feasibility / Delivery Considerations

Beauty / Skincare campaigns can fail commercially even when they are operationally completed. The brain should therefore treat brand-fit feasibility as well as execution feasibility seriously.

Important Feasibility Considerations

promoter grooming and product understanding

product explanation requirements

trial format suitability in venue

hygiene / handling requirements where applicable

whether demo/application context is simple or sensitive

premium-environment expectations vs actual execution scope

reporting expectations after trial

Brand-Fit Risks

cheap-feeling execution for premium product

wrong audience environment for brand tone

promoter interaction quality too weak for category depth

trial happening in a context that reduces perceived trust or desirability

12. Typical Objections and Response Directions

Response Principles

speak the language of audience quality, not just activity quantity

protect brand-image fit in every recommendation

do not sell scale-first if the brand is asking for premium relevance

use pilot framing when the brand is uncertain about touchpoint performance

13. Scoring Cues — Beauty / Skincare

Positive Signals

clear target user segment

premium-fit or audience-fit environment matters to the brand

product benefits from trial or education

brand is open to pilot-first validation

objective and segment are well articulated

the recommended touchpoint matches both audience and brand tone

Negative Signals

brand is premium but asks for low-quality mass distribution environment

no clarity on user segment

category education need is high but engagement budget is absent

expectation of strong conversion with no measurement design

touchpoint choice conflicts with brand positioning

Strategic Signals

high-credibility brand or D2C growth brand

strong case-study value in beauty/skincare vertical

potential for repeat use across launches / SKUs / regions

14. Recommendation Logic

When the lead is Beauty / Skincare, the system should prioritize recommendations using this order:

target user fit

brand-image / environment fit

objective fit

trial depth or education need

budget and feasibility

Typical Recommendation Patterns

Pattern A: Premium women professionals

IT Park Sampling

premium mall activation

pilot-first recommendation

Pattern B: Premium shopper/public visibility

Mall Sampling / Kiosk Activation

guided trial / demo support

Pattern C: Retail conversion support

In-Store / Retail Sampling

demo-led or education-led promoter support

Pattern D: Premium family / residential relevance

selective premium apartment / community sampling

Recommendation Output Style

The system should say things like:

“Because this is a premium skincare product targeting women professionals, a high-quality audience environment is likely more valuable than broad distribution volume.”

“A pilot across IT parks or premium mall environments may help validate trial quality before scale.”

“If product education is important, a kiosk/demo-led setup may perform better than handout-only distribution.”

15. Risk Flags

The system should explicitly warn when:

premium brand fit is being diluted by the recommended environment

audience precision is weak

product education need is high but execution is too light

the brief mixes performance expectations with awareness-only design

environment quality and brand expectations are misaligned

promoter/training requirements are underestimated

16. Case Study Tagging Guidance

Beauty / Skincare case studies should be tagged by:

premium vs mass orientation

women professionals / shoppers / families / youth audience

city

touchpoint

execution depth (handout / guided trial / demo / kiosk)

objective (trial / education / launch / retail support)

reporting depth

brand-positioning tone

Priority Case Study Buckets Needed First

premium skincare IT park sampling

beauty mall activation / kiosk example

skincare in-store retail education example

premium community sampling example

launch-stage trial + feedback example

17. Suggested JSON Shape

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Beauty / Skincare playbook goes live, AIM should complete the following:

founder review and wording approval

sales-head review of discovery prompts and objection handling

mapping of at least 3–5 relevant beauty/skincare case studies

validation of premium-vs-mass recommendation logic against real proposal history

refinement of buyer-persona notes based on AIM’s actual client mix

confirmation of service-ranking logic across IT parks, malls, retail, and premium communities

20. Recommended Immediate Next Playbook

After this Beauty / Skincare industry playbook, the next best playbook to fill is:

FMCG / Snacks / Beverages

Reason:

it is high-volume and commercially important for AIM

it contrasts sharply with Beauty / Skincare in scale logic and environment sensitivity

it will help the Entity Brain learn when to prioritize mass-trial logic versus premium-fit logic

AIM Industry-to-Service Decision Tree + Scenario Test Library

1. Document Purpose

This document converts AIM’s cross-industry recommendation logic into:

practical decision trees

scenario-based recommendation tests

expected outputs for evaluation

failure patterns to watch before go-live

It is designed to help AIM validate whether the Entity Brain can make founder-like decisions under realistic lead conditions.

This document should be used by:

founders

sales head

product/admin

engineering

QA/evaluation team

2. Why This Document Matters

The ranking matrix tells the system what is generally stronger.

But in real life, leads are messy.

A good engine must handle:

incomplete information

competing objectives

mixed audiences

budget/timeline tension

touchpoint bias from clients

category sensitivity

So this document exists to answer:

When a real lead appears, what path should the system follow, and what output should it generate?

3. Decision Tree Design Principles

Start with the business job, not the touchpoint the client casually mentions.

Check audience fit before cost optimization.

For sensitive or premium categories, environment quality can outrank raw scale.

If feasibility is weak, recommendation strength must drop even when fit looks good.

If multiple services are viable, choose the one that best solves the primary objective.

Use pilot-first when ambiguity is commercially meaningful.

Suppress attractive but misleading options.

4. Master Decision Flow

The engine should evaluate in this order:

identify industry

identify primary objective

identify target audience

identify trust / environment sensitivity

identify scale-first vs precision-first need

identify purchase-context need vs awareness-only need

identify handling / compliance / execution complexity

identify budget and timeline realism

identify whether one service clearly dominates or hybrid is justified

generate primary, secondary, optional expansion, and suppressed options

5. Core Decision Trees

5.1 Decision Tree A — Product Sampling vs Activation vs Mobile Visibility

Step 1

If the client’s primary job is trial, go to Sampling path.

Step 2

If the client’s primary job is education + trial + visible interaction, go to Activation path.

Step 3

If the client’s primary job is awareness / launch buzz / route visibility, go to Mobile Visibility path.

Rule

Do not recommend LED Van / Mobile Outreach as the primary solution when the client actually needs product trial or guided education.

5.2 Decision Tree B — Choosing the Right Sampling Environment

If target audience = working professionals

Prefer:

IT Park Sampling

premium mall only if public visibility matters too

workplace + premium hybrid if justified

If target audience = households / parents / families

Prefer:

RWA / Apartment Sampling

residential + retail hybrid

mall/family-footfall only when public visibility is also useful

If target audience = shoppers close to purchase

Prefer:

In-Store / Retail Sampling

retail + activation hybrid

mall only if purchase-context route is weak but trial still valuable

If target audience = students / youth

Prefer:

College / Campus Sampling

youth-heavy activation

mall only if public youth relevance is stronger than campus access

If target audience = fitness / performance users

Prefer:

Gym / Fitness Sampling

gym + workplace hybrid

premium public setup only if visibility matters too

5.3 Decision Tree C — Trust-Sensitive Category Rule

Applies to

Baby Care

Menstrual Hygiene

Pet Care

Wellness / Nutrition

premium Beauty / Skincare

Rule Path

If category is trust-sensitive:

evaluate whether environment feels credible and relevant

demote touchpoints that are operationally possible but contextually weak

prefer guided interaction when education matters

prefer pilot-first if audience/context performance is uncertain

Example

If Baby Care brief asks for broad public mall handout at scale:

do not reject immediately

but demote mall as primary unless family-footfall relevance is very strong and tone can remain controlled

promote residential or family retail alternatives first

5.4 Decision Tree D — Scale-First vs Precision-First

If category is FMCG / Snacks / Beverages

Ask:

is usage relevance broad?

is trial scale important?

are handling requirements manageable?

If yes:

recommend scale-capable environments first

If category is Beauty / Skincare, Wellness, Baby Care, Menstrual Hygiene, Pet Care

Ask:

does audience quality matter more than quantity?

does trust or education matter?

can the environment affect perception?

If yes:

recommend precision / quality-first environments first

5.5 Decision Tree E — Retail Conversion Need

If primary objective includes any of the following:

sell-out support

shopper education near purchase

store movement

pharmacy / retail conversion

Then:

promote In-Store / Retail Sampling to primary or near-primary rank

use mall / public trial only as a support layer if helpful

use awareness-led formats only as secondary support

Rule

Do not let “visibility” overpower “purchase-context need” when the client’s stated goal is sell-out or conversion support.

5.6 Decision Tree F — Pilot-First Trigger

Recommend pilot-first when any of these are true:

category is premium or trust-sensitive

the client is testing a new touchpoint

the environment fit is plausible but unproven

the product has handling or training complexity

the client wants proof before scale

multiple services look viable but not conclusively so

Output Pattern

primary recommendation

clear “pilot-first” label

phase 2 expansion path if pilot succeeds

5.7 Decision Tree G — Hybrid Recommendation Trigger

Recommend hybrid only when:

the brief includes two distinct audience clusters

the brief needs both trial and visibility

a single touchpoint solves only part of the job

the brand wants phase-wise validation across environments

Good Examples

Beauty / Skincare: IT Park + Mall

FMCG: IT Park + RWA + Retail

Wellness: Gym + Workplace

Baby Care: Premium Communities + Retail

Menstrual Hygiene: College + Workplace

Pet Care: Residential Communities + Pet Retail

Rule

Do not recommend hybrid by default when one service clearly solves the main objective well enough.

6. Scenario Test Library Structure

Each scenario includes:

lead brief

industry

objective

audience

known facts

unknowns

expected primary recommendation

expected secondary recommendation

expected suppression logic

whether pilot-first should trigger

why this case matters

7. Scenario Test Library

7.1 Scenario 1 — Premium Skincare Launch for Women Professionals

Lead Brief

A premium skincare brand wants to launch a serum in Bangalore and is targeting women professionals aged 24–35. They are considering sampling, want quality audience more than mass distribution, and have moderate budget.

Classified Inputs

Industry: Beauty / Skincare

Objective: Product Trial + Premium Introduction

Audience: Women Professionals

Geography: Bangalore

Budget: moderate

Timeline: within 30 days

Expected Output

Primary: IT Park Sampling

Secondary: Mall Sampling / Mall Activation

Optional Expansion: IT Park + premium mall hybrid

Suppress: LED Van as primary

Pilot-First: Yes

Why

Audience precision is stronger than public visibility as the primary job.

7.2 Scenario 2 — Snack Brand Wants High-Volume Trial in Bangalore

Lead Brief

A snack brand wants 25,000 sample trials in Bangalore over 2 weeks. They are open to colleges, IT parks, and malls. Product is simple to distribute and there are no heavy handling constraints.

Classified Inputs

Industry: FMCG / Snacks / Beverages

Objective: Mass Trial

Audience: broad youth + office-goers

Geography: Bangalore

Budget: reasonable

Handling: simple

Expected Output

Primary: Hybrid Campaign Solution

Secondary: IT Park Sampling or College Sampling depending city mix

Optional Expansion: Mall sampling for public visibility layer

Suppress: premium-only narrow channels as sole recommendation

Pilot-First: No, unless budget/timeline uncertainty exists

Why

This is a scale-first, usage-friendly product with multiple viable high-volume environments.

7.3 Scenario 3 — Protein Beverage for Fitness Audience

Lead Brief

A wellness brand wants to push a protein hydration drink among active gym-goers in Bangalore and Hyderabad. The team wants the right users, not random scale.

Classified Inputs

Industry: Wellness / Nutrition

Objective: Trial + Affinity Audience Introduction

Audience: Fitness Users

Geography: Bangalore, Hyderabad

Priority: affinity-first

Expected Output

Primary: Gym / Fitness Sampling

Secondary: IT Park Sampling if office-going wellness crossover exists

Optional Expansion: gym + workplace hybrid

Suppress: random mall/public trial as primary

Pilot-First: Yes

Why

Credibility of context matters. Fitness relevance outranks generic high-footfall reach.

7.4 Scenario 4 — Baby Care Product for Young Parents

Lead Brief

A premium baby-care brand wants to introduce a new lotion to parents of infants and toddlers in Bangalore. They care about trust and relevance more than mass reach.

Classified Inputs

Industry: Baby Care

Objective: Trust-Building Trial

Audience: Parents of infants and toddlers

Geography: Bangalore

Priority: trust-first

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling

Optional Expansion: premium communities + retail hybrid

Suppress: college, gym, LED van as primary

Pilot-First: Yes

Why

Trust-relevant family environment should dominate the recommendation.

7.5 Scenario 5 — Menstrual Hygiene Campaign for College Students

Lead Brief

A menstrual hygiene brand wants to build awareness and trial among college-age women in Chennai and Bangalore. Education is as important as product introduction.

Classified Inputs

Industry: Menstrual Hygiene

Objective: Education + Trial

Audience: College students

Geography: Chennai, Bangalore

Tone sensitivity: high

Expected Output

Primary: College / Campus Sampling

Secondary: Kiosk-Based Education / Activation Booth

Optional Expansion: college + workplace phase 2 if brand expands audience

Suppress: LED Van as primary, generic mass public handout

Pilot-First: Yes

Why

Education and comfort fit matter more than raw broad reach.

7.6 Scenario 6 — Pet Food Trial for Premium Pet Parents

Lead Brief

A pet-food brand wants to reach dog owners in premium apartment communities in Bangalore. They do not want broad household waste.

Classified Inputs

Industry: Pet Care

Objective: Targeted Trial

Audience: Dog owners in premium communities

Geography: Bangalore

Priority: owner relevance

Expected Output

Primary: RWA / Apartment Sampling

Secondary: In-Store / Retail Sampling in pet retail environments

Optional Expansion: premium community + pet retail hybrid

Suppress: mall/public mass distribution as primary

Pilot-First: Yes

Why

Pet-owner density and audience precision are critical.

7.7 Scenario 7 — Beverage Launch Wants Buzz, Not Sampling

Lead Brief

A beverage brand wants city-wide launch buzz for 5 days in Bangalore and Hyderabad. They want strong visibility fast and are not focused on trial in phase 1.

Classified Inputs

Industry: FMCG / Beverages

Objective: Awareness / Launch Buzz

Audience: broad public

Geography: Bangalore, Hyderabad

Speed: high

Expected Output

Primary: LED Van / Mobile Outreach

Secondary: Mall Activation if public visibility and physical brand presence are also needed

Optional Expansion: mobile outreach + selective sampling in phase 2

Suppress: product sampling as sole phase-1 recommendation if trial is not the current job

Pilot-First: Not necessary unless city/route ambiguity is high

Why

The core job is visibility, not trial.

7.8 Scenario 8 — Skincare Brand Wants Retail Sell-Out Support

Lead Brief

A skincare brand is already in a retail chain and wants stronger trial and shopper education to improve sell-out in 20 stores.

Classified Inputs

Industry: Beauty / Skincare

Objective: Sell-Out Support

Audience: Retail shoppers near purchase

Geography: Bangalore

Retail context: strong

Expected Output

Primary: In-Store / Retail Sampling

Secondary: Kiosk-Based Demo support where useful

Optional Expansion: retail + selective mall awareness if needed later

Suppress: IT Park as primary unless secondary objective emerges

Pilot-First: Yes if store behavior is untested

Why

Purchase-context need outranks premium audience experimentation.

7.9 Scenario 9 — Ambiguous Marquee FMCG Brief

Lead Brief

A well-known FMCG brand says, “We want something impactful pan-India,” but shares no real audience, no budget, and no clear objective.

Classified Inputs

Industry: FMCG

Objective: unclear

Audience: unclear

Budget: unknown

Strategic value: high

Expected Output

Primary: No strong service recommendation yet

Secondary: none until discovery improves

Optional Expansion: not applicable yet

Suppress: premature multi-touchpoint grand solution

Pilot-First: not yet; first recommend structured discovery

Escalation: Yes, high-value but low-confidence

Why

The system must resist looking smart by inventing a solution too early.

7.10 Scenario 10 — Budget-Misaligned Premium Mall Request

Lead Brief

A new brand asks for a premium multi-city mall activation but indicates a very low budget and wants immediate execution.

Classified Inputs

Industry: unknown consumer brand

Objective: visibility + trial perhaps

Budget: weak

Timeline: aggressive

Requested touchpoint: premium mall

Expected Output

Primary: Re-scope / clarify, not direct mall confirmation

Secondary: lighter public trial or pilot recommendation if relevant

Suppress: premium mall rollout as-is

Pilot-First: Yes if the client shows flexibility

Escalation: only if strategic value is high

Why

The system must protect against unrealistic client-led touchpoint bias.

8. Negative Test Cases

These are scenarios where the system should fail safely rather than force a recommendation.

8.1 Negative Case — Too Little Information

Expected behavior:

ask next-best question

do not recommend a service confidently

do not mark proposal-ready

8.2 Negative Case — High Budget but Wrong Audience Context

Expected behavior:

demote attractive but brand-weak environments

explain why a more relevant environment is stronger

8.3 Negative Case — Client Insists on Misfit Touchpoint

Expected behavior:

acknowledge the requested touchpoint

explain limitations

suggest better alternative

do not blindly confirm requested service as primary

8.4 Negative Case — High Strategic Brand, Low Confidence

Expected behavior:

escalate

avoid overcommitting

produce structured missing-information summary

9. Scenario Evaluation Rubric

Use this rubric to judge whether the engine behaves correctly.

Suggested Pass Standard

A scenario should pass only if the system gets the primary path, suppression logic, and reasoning explanation broadly right.

10. Expected Failure Patterns to Watch

During testing, watch for these recurring failures:

recommending the client’s mentioned touchpoint too early

overvaluing scale in trust-sensitive categories

overvaluing premium environments for broad FMCG needs

recommending hybrid campaigns too often

recommending LED/mobile formats when the true job is trial or education

weak suppression of misfit services

false proposal-readiness despite major unknowns

11. Suggested Testing Cadence

Round 1: Founder Calibration

run 10 scenarios manually with founder review

compare system recommendation vs founder recommendation

Round 2: Sales Calibration

run 10–15 real historical leads

compare recommendation usefulness for sales users

Round 3: Ops Calibration

test feasibility-sensitive scenarios

check whether the system under-warns or over-warns

Round 4: Pilot Live Monitoring

log real-world scenarios where recommendation changed after human review

turn those into new test cases

12. Suggested Scenario JSON Format

```
{
"scenario_id": "SCN-001",
"industry": "Beauty / Skincare",
"objective": "Product Trial",

13. Validation Checklist

14. Publication Readiness Checklist — Pending Actions

Before this decision-tree and scenario library goes live, AIM should complete the following:

founder review of all major scenario expectations

sales-head review of recommendation usefulness across real examples

ops review for feasibility-sensitive cases

addition of 15–20 real AIM historical lead scenarios

mapping of each scenario to service-record and industry-playbook IDs

creation of pass/fail evaluation sheet for QA and pilot reviews

15. Recommended Immediate Next Artifact

After this decision-tree and scenario test library, the next strongest artifact is:

Founder Calibration Workbook + Historical Lead Test Set

Reason:

the rules are now defined

the next step is to validate them against AIM's actual founder judgment and past leads

this is the fastest way to catch wrong defaults before build hardening

AIM Product Sampling (Core) — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for Product Sampling (Core) from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas so that:

the main document remains lighter and safer to manage

the Product Sampling pack can be reviewed, validated, and iterated independently

AIM can use this as the working parent service record for ingestion

This is the parent service record for Product Sampling. Child services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

2. Service Record Header

3. Service Definition

Working Definition

Product Sampling is AIM's controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

4. Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following:

product trial

awareness through physical experience

new product launch support

target-group-specific introduction

category education

sell-out assistance in supported environments

feedback collection after trial

trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

5. Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

6. Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

7. Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

8. Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

9. Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known:

product category

target audience

geography

timeline band

sample volume or scale band

preferred touchpoint or touchpoint recommendation path

campaign model (pilot / rollout)

budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

10. Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following:

permission dependency by chosen touchpoint

product handling requirements

temperature / tasting / demo constraints if any

timeline realism

promoter/staffing need

branding/setup scope if applicable

city-level ops availability

reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

11. Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by:

touchpoint type

city and geography spread

sample volume

campaign duration

promoter/manpower need

setup / kiosk / branding requirement

permissions dependency

reporting complexity

handling complexity of sample product

campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

12. Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

13. Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

14. Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say:

“Product Sampling is a strong parent fit.”

then recommend child path(s) with reason

then show assumptions and missing inputs before final scoping

15. Risk Flags

The system should explicitly warn when:

product category and venue appear mismatched

target audience is too broad for current scope

timeline may not support permissions or setup

scale is too low for chosen touchpoint economics

attribution expectations exceed planned campaign design

sample handling requirements are still unclear

16. Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by:

industry

objective

touchpoint

geography

audience type

scale band

reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

17. Service Record JSON Shape (Suggested)

18. Validation Checklist — Filled

19. Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of objections and discovery questions

ops validation of feasibility risks and handling constraints

case-study mapping for at least 3 strong parent references

confirmation of child-service inheritance model in knowledge schema

approval of parent scoring cues and escalation triggers

20. Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is:

IT Park Sampling

Reason:

it is one of AIM’s highest-value sampling variants

it frequently needs nuanced founder judgment

it will help validate how parent-child service inheritance should work in the Entity Brain

AIM IT Park Sampling — Filled Service-Record Pack

1. Document Purpose

This document contains the standalone filled service-record pack for IT Park Sampling from the AIM Entity Brain knowledge-ingestion framework.

It is separated from the main PRD canvas and from the Product Sampling parent pack so that:

the service can be reviewed independently

parent-child inheritance can be validated clearly

AIM can iterate this touchpoint-specific logic without bloating the larger documents

This is a child service record under the parent service Product Sampling.

2. Service Record Header

3. Service Definition

Working Definition

IT Park Sampling is AIM’s targeted product sampling service executed inside office parks, tech parks, business campuses, or workplace clusters to reach working professionals and salaried urban consumers in a controlled, audience-relevant environment.

What This Service Includes

office-park / workplace touchpoint recommendation

park-type or audience-tier selection where possible

promoter-led sampling or kiosk-led interaction depending on brief

sample distribution to working-professional audience

optional product education or guided interaction

basic campaign reporting and proof of execution

optional feedback capture or QR-led response mechanism where appropriate

What This Service Does Not Automatically Include

guaranteed access to every named corporate park

guaranteed employee database capture

guaranteed consumer conversion or sales attribution

heavy fabrication or premium kiosk scope unless explicitly added

deep enterprise compliance handling unless designed in scope

4. Child-Service Purpose and Role Under Product Sampling

IT Park Sampling should be recommended when the parent service Product Sampling is already a strong fit, and the target audience is best described as:

working professionals

office-goers

salaried urban audience

premium or aspirational employee clusters

weekday consumer audience in business hubs

What This Child Service Solves Especially Well

targeted access to working professionals

urban premium or semi-premium trial environments

product introduction during weekday routines

category trial among employed decision-makers

trial and education for products suited to productivity, wellness, convenience, or premium self-care

5. Best-Fit Objectives

Strongest Objectives

product trial among working professionals

awareness with targeted urban audience fit

category education for employed consumers

premium product introduction in business environments

launch-stage trial with audience precision

office-going TG sampling with optional engagement

Moderate Objectives

broad awareness where office-going audience is still relevant

feedback-led campaigns where the brand wants directional user response

pilot campaigns to test premium audience receptivity

Weak Objectives

household-only targeting

family decision-maker targeting without professional audience relevance

student-first campaigns

purely impulse mass reach without care for office-going profile

6. Best-Fit Industry and Category Logic

Best-Fit Industries

beauty and skincare

personal care

wellness and nutrition

beverages

premium FMCG

convenience foods/snacks for working professionals

health-oriented or productivity-adjacent products

Best-Fit Product Traits

product is relevant to employed urban consumers

product benefits from premium or aspirational setting

product trial can be quick and easy in a workplace environment

product can be distributed or explained without heavy operational friction

Moderate-Fit Product Traits

broader FMCG product with office-goer relevance but not premium positioning

snack or beverage product that can benefit from weekday office consumption context

Weak-Fit Product Traits

products that require family or household decision context first

products that need long dwell-time demo not suited to office touchpoint conditions

products with complex handling or compliance needs not designed for corporate environments

7. Fit and Misfit Logic

Strong Fit Signals

prospect explicitly targets working professionals, office-goers, white-collar employees, or urban premium consumers

brand wants targeted rather than generic mass sampling

weekday environment makes sense for the product

brand is open to employee-friendly formats like kiosk, promoter handout, or light engagement

product is easy to sample or explain in a workplace setting

Moderate Fit Signals

brand wants premium TG but has not yet chosen between IT parks and malls

target audience is broadly urban professional but touchpoint decision is still open

client is exploring a pilot to test audience quality

Misfit Signals

household/family targeting is clearly primary

client wants very broad public reach without audience precision

product is not naturally relevant to working professionals

timeline is too short for access coordination or park selection

client expects access to specific named parks without understanding permissions/availability realities

budget is too low for meaningful workplace execution

8. Audience Logic

This service should force the Entity Brain to refine “working professionals” more precisely.

Key Audience Dimensions to Capture

general office-going audience vs premium working professionals

gender relevance if category-specific

age band

income / premium orientation

weekday relevance of product use

office campus type preference if any

Audience Positioning Examples

premium skincare for women professionals → premium corporate parks / premium employee clusters

functional beverage for general office-goers → high-footfall office campuses

nutrition/wellness product → health-conscious workplace or white-collar employee settings

convenience snack for office routines → volume-led parks or mixed office campuses

9. Core Service Models Within IT Park Sampling

The Entity Brain should understand the main execution models.

Model A: Promoter-Led Handout

Best when:

simple product trial is enough

quick interaction is acceptable

minimal setup is desired

cost sensitivity exists

Model B: Kiosk / Table-Led Sampling

Best when:

some visibility and interaction are needed

brand wants a stronger presence

sample explanation or guided pitch matters

premium product positioning matters

Model C: Engagement-Linked Sampling

Best when:

brand wants stronger recall or micro-engagement

QR, feedback, or small educational layer is useful

client wants a more premium or controlled trial experience

Important Rule

The system should not assume kiosk is required. It should first ask whether handout-only, light interaction, or branded setup is needed.

10. Discovery Question Bank — IT Park Sampling Specific

These questions should load after the parent Product Sampling questions establish that workplace audience fit is likely.

11. Quote-Critical Inputs

Before the system gives a meaningful budgetary direction for IT Park Sampling, the following should preferably be known:

city or cities

target audience quality (general office-goer vs premium professionals)

campaign scale or sample volume

execution model (handout / table / kiosk)

branding requirement if any

campaign duration or date band

pilot vs rollout intent

budget band or at least budget openness

Minimum for Capability Deck

office-going audience established

city known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

volume or scale roughly known

venue tier direction known

execution model roughly known

Minimum for Scoped Proposal

above fields known

duration clarified

branding/setup scope clarified

feasibility risk not materially high

12. Feasibility-Critical Inputs

The system should not overstate confidence until the following are considered:

office park access / permission model

venue tier and access practicality

setup allowance (if kiosk/table required)

product handling suitability in workplace environment

weekday timing constraints

staffing model viability

city-level ops readiness

whether data capture expectations are realistic in the proposed format

Common Feasibility Risks

named park requested without real access path

client expects premium parks on a low budget

product handling requires support not yet scoped

client wants kiosk/branding but timeline is too compressed

expectation of employee data capture is too aggressive for environment

13. Pricing Driver Logic

IT Park Sampling is typically influenced by:

city and location cluster

venue tier (premium vs high-footfall / standard)

promoter vs table vs kiosk model

number of activity days

sample volume

manpower requirement

branding/setup requirement

reporting / QR / engagement depth

access coordination complexity

Important Rule

The system should not convert “IT park” into a flat price assumption. Venue quality, execution model, and scope depth matter materially.

14. Common Objections and Recommended Responses

Response Principles

sell audience fit, not just venue prestige

avoid overpromising specific park access

use premium-vs-volume trade-off language clearly

simplify scope when the client is unsure or cost-sensitive

15. Scoring Cues — IT Park Sampling Specific

Positive Scoring Signals

clear working-professional audience

urban premium or office-use product relevance

pilot openness

realistic city focus

willingness to consider park-tier recommendation instead of insisting blindly on specific venues

objective is trial / awareness / education rather than unrealistic hard-conversion guarantee

Negative Scoring Signals

premium audience demand on weak budget

no clarity on product relevance to office-going users

insistence on named venues with no flexibility

timeline too short for realistic planning

broad household objective disguised as office sampling

Strategic Value Signals

premium brand looking for professional audience entry

category where working-professional sampling can become a repeat playbook

multi-city office rollout potential

16. Recommendation Logic

When IT Park Sampling is recommended, the system should explain:

why workplace audience fit is strong

whether premium, volume-focused, or mixed park strategy is appropriate

whether promoter-only, table, or kiosk model is best

whether pilot-first is recommended

what assumptions are still pending confirmation

Recommendation Output Style

The system should say things like:

“IT Park Sampling appears to be a strong fit because your target audience is working professionals in Bangalore.”

“A pilot-first approach may be appropriate before broader rollout.”

“We should clarify whether you prefer premium employee clusters or broader office-footfall coverage, as this will affect scope and budget.”

17. Risk Flags

The system should explicitly warn when:

audience fit to office-going consumers is weak

product use context does not suit workplace trial

premium venue demand is mismatched to budget

client expects guaranteed named-park access

timing is too compressed for setup/access-dependent model

branding/data-capture expectation adds hidden complexity

18. Case Study Tagging Guidance

Case studies under IT Park Sampling should be tagged by:

product category

gender focus if relevant

city

park tier (premium / mixed / broad)

execution model (promoter / table / kiosk)

objective (trial / education / awareness)

reporting depth

Priority Case Study Buckets Needed First

beauty/skincare for women professionals

wellness / nutrition for office-goers

beverages / snacks for working audience

premium workplace trial campaign

high-footfall office park campaign

19. Suggested JSON Shape

20. Validation Checklist — Filled

21. Publication Readiness Checklist — Pending Actions

Before this IT Park Sampling child record goes live, AIM should complete the following:

founder review and wording approval

sales-head review of must-ask questions and objection handling

ops validation of access, timing, and setup assumptions

mapping of at least 2–3 relevant case studies

validation of premium-vs-volume venue logic with real proposal history

confirmation of inheritance link to Product Sampling parent record

22. Recommended Immediate Next Pack

After this filled IT Park Sampling record, the next best record to fill is:

RWA / Apartment Sampling

Reason:

it provides a contrasting audience and feasibility model to IT parks

it helps sharpen parent-child recommendation logic

it is important for household, family, and community-oriented categories

AIM Entity Brain — Product Requirements Document (PRD)

1. Document Summary

Product Name: AIM Entity Brain

Prepared For: AIM Leadership, Sales, Ops, Product, Engineering

Primary Goal: Convert founder-level commercial knowledge into a structured, scalable intelligence system that can qualify leads, guide discovery, recommend solutions, score opportunities, and sync clean intelligence into CRM.

2. Problem Statement

AIM’s best commercial judgment currently lives in the founders’ heads.

This creates recurring gaps: - Sales team depends too heavily on founders for requirement understanding and solution mapping. - Leads often come in with incomplete information, making proposal creation difficult or slow. - Discovery quality varies by salesperson. - Follow-up questions are sometimes repetitive, irrelevant, or not commercially useful. - CRM records are incomplete and inconsistent. - High-intent leads are not always identified early enough. - AI automation for chat or calling cannot work well without a strong company intelligence layer.

The business needs a system that can think more like a founder during lead intake and discovery.

3. Product Vision

AIM Entity Brain will be the company’s commercial reasoning layer.

It will: - understand services, sub-services, industries, deliverables, timelines, pricing logic, constraints, and case studies - ask the right next question based on context - avoid repetitive or low-value questioning - map lead requirements to solution pathways - score leads using AIM-specific commercial logic - assign the right salesperson or escalate for founder review - generate structured summaries and CRM-ready data - continuously improve from win/loss and human override feedback

This is not just a chatbot. It is a decision engine with memory, workflow, and learning.

4. Product Objectives

Primary Objectives

Improve discovery quality across all inbound leads.

Reduce founder dependency during lead qualification and solutioning.

Increase speed from inquiry to proposal readiness.

Improve CRM data quality and structured lead intelligence.

Create a reusable intelligence layer for sales copilot, chatbot, and AI telecalling.

Secondary Objectives

Improve lead routing and prioritization.

Reduce wasted effort on low-fit leads.

Standardize early-stage requirement gathering.

Improve consistency of proposal inputs.

Build long-term institutional memory.

5. Users

Primary Users

Sales Executives

Senior Sales Team

Sales Head

Founders

Business Development Team

Secondary Users

Operations team

Proposal team

CRM admins

Product and engineering team

External Users (Later Phase)

Website visitors

WhatsApp inquiry prospects

Outbound call recipients

6. User Problems to Solve

Sales Team Problems

“I do not know what to ask next.”

“I do not know if I have enough information to quote.”

“I do not know which service combination to pitch.”

“I need founder support for every nuanced inquiry.”

Founder Problems

“Sales keeps asking the same kind of questions.”

“Leads reach me with incomplete briefs.”

“Proposals are delayed because discovery was weak.”

“Commercial thinking is not standardized.”

Operations Problems

“Sales overpromises without checking feasibility.”

“Requirements are incomplete or vague during handoff.”

CRM Problems

“Lead records are incomplete.”

“Important commercial fields are unstructured.”

“Scoring and routing are inconsistent.”

7. Scope Definition

In Scope (Phase 1–3)

Service intelligence

Industry intelligence

Discovery question engine

Lead scoring engine

Solution recommendation engine

CRM field mapping

Internal sales copilot

External discovery chatbot

Case study retrieval

Proposal readiness assessment

Human override and feedback capture

Out of Scope (Initial Phase)

Fully autonomous proposal generation with final pricing approval

Fully autonomous discounting

End-to-end unattended telecalling at scale

Contract drafting automation

Final execution planning without human review

8. Core Product Principles

Ask only what changes the commercial decision.

Do not repeat what is already known.

Separate confirmed facts from inferred facts.

Do not promise beyond approved service logic.

When confidence is low, escalate to human review.

Every interaction should improve future intelligence.

9. Product Modules

9.1 Service Intelligence Engine

This module stores AIM’s service structure.

It should know: - service categories - sub-services - fit conditions - misfit conditions - ideal industries - ideal use cases - pricing bands - typical lead time - deliverables - exclusions - dependencies - risks - add-ons - reporting capabilities

Example Output

For a product sampling inquiry, the module should identify whether the use case is better suited for: - IT park sampling - mall activation - RWA sampling - in-store retail sampling - gym activation - quick commerce integration - multi-touchpoint pilot

9.2 Industry Intelligence Engine

This module stores how industries behave commercially.

It should know: - industry goals - buyer personas - decision cycles - budget behavior - common objections - relevant pitch angles - preferred channels/touchpoints - compliance or sensitivity issues - seasonality

Example

Skincare launches may require: - women-focused TG segmentation - premium environment fit - trial plus feedback mechanism - attribution discussion if D2C or marketplace-linked

9.3 Discovery Engine

This is the questioning brain.

It should: - identify critical missing information - select the next-best question - avoid duplicate questions - skip irrelevant questions - understand when enough information exists for the next stage - classify answers into structured CRM fields

Discovery Logic Rules

Each question should be tagged by: - service relevance - industry relevance - commercial purpose - mandatory for quote? - mandatory for feasibility? - mandatory for scoring? - ask-if conditions - skip-if conditions

Output Types

confirmed field update

inferred field update

missing information list

next-best question

9.4 Solution Mapper

This module translates discovery into recommended commercial solutions.

It should answer: - what service or sub-service fits best? - what touchpoint mix is appropriate? - should we propose pilot or full rollout? - what budget band is likely? - what timeline is realistic? - which case studies are relevant? - what risks should be flagged?

Example

If the lead is a beauty brand targeting working women in Bangalore with moderate budget and short timeline, the system may recommend: - IT parks + premium malls as primary mix - phase 1 pilot before scale - feedback capture + QR-based redemption - case studies from beauty/personal care category

9.5 FitScore Engine

This module calculates opportunity quality.

Score Components

Fit Score — 25

Authority Score — 15

Urgency Score — 15

Budget Score — 15

Completeness Score — 10

Strategic Value Score — 10

Feasibility Score — 10

Score Output Bands

80–100: High-priority qualified lead

60–79: Good lead, standard follow-up

40–59: Needs more information or nurture

Below 40: Low-fit or low-priority lead

Uses of Score

routing

SLA priority

founder escalation

proposal urgency

nurture vs immediate pursuit

9.6 Proposal Readiness Engine

This module checks whether enough information exists to move to proposal.

It should determine:

ready for capability deck only

ready for budgetary estimate

ready for scoped proposal

not ready; more discovery needed

It should also generate:

discovery summary

missing commercial inputs

suggested proposal modules

suggested case studies

suggested next action

9.7 CRM Intelligence Sync

This module converts conversation into structured CRM records.

It should update:

lead basic profile

service and sub-service

industry

objective

budget band

timeline

authority level

target audience

geography

completeness score

total lead score

recommended owner

recommended next step

missing information

It should also trigger:

task creation

SLA tagging

owner assignment

escalation to sales head/founder if required

9.8 Sales Copilot

This is the first interface to launch.

Primary Capabilities

show current lead understanding

show missing fields

suggest next questions during live call/chat

recommend service path

show lead score

show risks and assumptions

suggest case studies and pitch angle

indicate proposal readiness

Success Outcome

A salesperson should be able to handle a nuanced discovery conversation with much less founder intervention.

9.9 Discovery Chatbot

This is the second interface to launch.

Channels

website

WhatsApp

chat widget

Primary Capabilities

welcome and classify inquiry

ask context-aware questions

avoid repetitive questions

gather structured requirement data

create CRM lead

summarize requirements before handoff

hand over to human with clean context

Design Principle

The experience should feel like a smart pre-consultation, not a long lead form.

9.10 Voice Prospecting Engine (Later Phase)

This is the third interface to launch.

Uses

cold outreach

qualification calls

callback handling

early intent screening

It should use the same brain for:

pitch selection

objection handling

qualification logic

next-step routing

Strong Controls Needed

human escalation rules

no unsupported claims

no unapproved commercial commitments

call review and audit trail

10. Core Data Model

Key Objects

Service Master

Sub-Service Master

Industry Playbook

Discovery Question Bank

Solution Rules

Lead Profile

Lead Answers

Case Study Library

Objection Library

Proposal Modules

Feedback Events

Version Log

Field Status Types

Each commercially important field should have a status: - Confirmed - Inferred - Missing - Not Applicable

This is important so the system never confuses assumptions with actual customer-provided facts.

11. CRM Field Definitions

12. Key User Flows

12.1 Inbound Lead via Website / WhatsApp

User starts inquiry.

System classifies probable service and industry.

Relevant discovery logic loads.

Bot asks next-best question.

Structured fields are populated.

Lead score updates in real time.

Proposal readiness is evaluated.

CRM record is created/updated.

Salesperson is assigned.

Discovery summary is pushed to assigned owner.

12.2 Salesperson-Assisted Discovery

Salesperson opens lead.

Copilot shows known data and missing commercial fields.

Copilot suggests next-best questions.

Salesperson captures answers.

Engine updates score and recommendations.

Proposal readiness is checked.

Next action is recommended.

12.3 Founder Review Escalation

Lead has high strategic value or low confidence.

System flags for founder review.

Founder sees summarized context, missing information, and system recommendation.

Founder accepts, edits, or overrides.

Override is stored as learning input.

13. Screens / Interface Requirements

13.1 Lead Intelligence Dashboard

Must show: - lead overview - service classification - key requirement fields - score breakdown - confidence level - missing information - suggested next questions - recommended owner - proposal readiness

13.2 Discovery Panel

Must show: - live transcript or answer stream - questions already asked - fields already collected - next-best question suggestions - skipped questions and reason

13.3 Solution Recommendation Panel

Must show: - recommended service mix - why it is recommended - alternative options - likely budget band - timeline band - case studies - risks

13.4 Founder Review Panel

Must show: - summary - score - assumptions - missing information - escalation reason - approve / modify / override actions

13.5 Admin Knowledge Management Panel

Must allow: - add/edit services - add/edit question bank - update scoring logic - tag case studies - version control - activate/deactivate outdated logic

14. Functional Requirements

Must Have

structured service and industry knowledge storage

context-aware questioning

field-level state tracking

CRM field mapping

lead scoring

assignment logic

proposal readiness detection

human override capture

case study retrieval

audit logs

Should Have

objection handling suggestions

pitch-angle recommendation

email/WhatsApp summary generation

founder override analytics

win/loss learning dashboards

Later

AI voice calling

automated meeting scheduling

auto-generated tailored proposal drafts

predictive win probability

15. Non-Functional Requirements

fast enough for live salesperson use during calls

support multi-turn stateful conversations

secure access control by role

full auditability of question/answer flow

version control for service logic

scalable across multiple services and future brands

reliable CRM sync

fallback behavior if model confidence is low

16. Guardrails and Governance

Commercial Guardrails

no final price commitment without approved logic

no unsupported delivery promise

no unauthorized discounts

no invented case studies or results

Reasoning Guardrails

always distinguish confirmed vs inferred data

ask only relevant questions

never repeat confirmed questions

stop when enough information is available

escalate when confidence falls below threshold

Operational Guardrails

all high-value leads with low confidence require review

all overrides should be logged

all service definitions and question logic must be versioned

17. Analytics and Success Metrics

Sales Productivity Metrics

founder interruptions per lead

average discovery completeness score

average time to proposal readiness

average time from inquiry to first qualified summary

Lead Quality Metrics

qualified lead rate

high-score lead conversion rate

disqualification accuracy

proposal-to-win ratio

Bot Quality Metrics

duplicate question rate

irrelevant question rate

missing-field rate after discovery

confidence/escalation rate

structured field accuracy

Learning Metrics

number of founder overrides

override categories

recommendation accuracy over time

score accuracy vs actual sales outcomes

18. Phased Rollout Plan

Phase 1 — Knowledge and Logic Foundation

Deliverables

service taxonomy

sub-service taxonomy

industry playbooks

discovery question bank

lead scoring model

CRM field map

case study library tagging

founder override workflow

Goal

Create the structured commercial brain.

Phase 2 — Internal Sales Copilot

Deliverables

lead intelligence dashboard

live discovery assistant

CRM sync

score and routing engine

proposal readiness engine

Goal

Improve internal discovery and reduce founder dependence.

Phase 3 — External Discovery Bot

Deliverables

website/WhatsApp bot

stateful questioning

automatic lead structuring

human handoff summary

Goal

Qualify inbound leads consistently before sales handoff.

Phase 4 — Voice Prospecting Engine

Deliverables

AI outbound calling

transcript intelligence

callback routing

objection capture

review dashboard

Goal

Scale prospecting using the same entity brain.

19. Risks

Risk 1: Overloading with raw documents

Mitigation: normalize critical knowledge into structured entities.

Risk 2: Weak discovery logic

Mitigation: start with founder-reviewed question banks and override loops.

Risk 3: Overpromising by AI

Mitigation: strong commercial guardrails and required confidence thresholds.

Risk 4: Low user adoption by sales team

Mitigation: design for live call usability and measurable productivity benefits.

Risk 5: Incorrect scoring early on

Mitigation: tune scoring model with real lead outcomes and founder reviews.

20. MVP Definition

MVP Includes

core services and sub-services

top target industries

60–100 curated discovery questions

service recommendation logic

scoring engine

CRM writeback

internal sales copilot

founder review/override capture

MVP Excludes

public chatbot at launch

voice calling at launch

autonomous final pricing

autonomous proposal issuance

21. Launch Recommendation

Launch order should be: 1. Knowledge Core 2. Sales Copilot 3. CRM Intelligence Sync 4. External Discovery Bot 5. Voice Prospecting Engine

This sequence gives the fastest ROI and the safest learning loop.

22. Final Recommendation

AIM should build this first as an internal commercial intelligence and discovery copilot, not as a public chatbot.

Reason: - internal copilot creates immediate value - improves lead quality and CRM quality - generates training data - validates discovery logic safely - reduces founder dependency before customer-facing automation

Once internal discovery is strong, the same brain can power inbound chatbot and outbound AI calling with much higher accuracy and much lower risk.

23. Next Document to Create

After this PRD, the recommended next documents are: 1. Functional specification by module 2. CRM field mapping sheet 3. Knowledge model / ontology document 4. User stories and acceptance criteria 5. API and integration specification 6. Wireframes for dashboard and copilot screens 7. Rollout plan with owners and milestones

24. Module-wise Functional Specification

24.1 Module: Knowledge Core

Purpose

Store and manage AIM’s structured commercial intelligence.

Inputs

service definitions

sub-service definitions

industry playbooks

discovery questions

pricing bands

case studies

objections

proposal modules

execution constraints

version changes

Core Functions

create and maintain service records

create and maintain industry records

manage question bank with conditions

manage solution rules

manage case study tagging

manage version history

activate/deactivate outdated logic

Outputs

structured knowledge objects for orchestration engine

searchable case studies and commercial assets

version-controlled service logic

Business Rules

every active service must have at least one discovery path

every service must define mandatory inputs for quote and feasibility

every question must be mapped to a field or decision purpose

outdated logic must not be used in live workflows once deactivated

Dependencies

admin panel

database

retrieval store

access control

Admin Actions

add service

edit service

archive service

add industry playbook

edit questions

adjust scoring logic references

upload case study assets

24.2 Module: Discovery Engine

Purpose

Run context-aware questioning and field-state tracking.

Inputs

current lead state

known fields

missing fields

service context

industry context

prior questions asked

confidence signals

Core Functions

classify inquiry

identify critical unknowns

select next-best question

avoid duplicate questioning

mark fields as confirmed/inferred/missing/not applicable

determine if enough information exists to proceed

Outputs

next-best question

updated field state

missing information list

discovery summary

proposal readiness signal

Business Rules

do not ask a question if field is already confirmed unless clarification is required

ask only questions relevant to current service and stage

stop discovery when minimum information threshold is reached for next step

low-confidence inference must be marked as inferred, not confirmed

Dependencies

knowledge core

orchestration engine

CRM field map

conversation layer

24.3 Module: Solution Mapper

Purpose

Translate discovered requirements into commercially relevant solution paths.

Inputs

service classification

industry classification

discovered lead attributes

solution rules

case studies

pricing references

feasibility notes

Core Functions

recommend service and sub-service mix

recommend touchpoint mix

suggest pilot vs full rollout

estimate budget band

estimate timeline band

identify relevant case studies

highlight delivery risks and dependencies

Outputs

recommended solution path

alternative options

budget band suggestion

timeline guidance

case study shortlist

risk flags

Business Rules

no final pricing commitment without approved pricing logic

if feasibility is unclear, flag human review

solution recommendations must reference only active services

24.4 Module: FitScore Engine

Purpose

Score the lead according to AIM-specific commercial logic.

Inputs

authority data

fit data

budget data

urgency data

completeness state

feasibility state

strategic value indicators

Core Functions

calculate component scores

calculate total score

assign lead band

recommend SLA level

recommend escalation path

Outputs

score breakdown

total score

confidence score

routing recommendation

Business Rules

missing critical fields should reduce completeness and confidence

high strategic value can increase priority but should not hide feasibility issues

leads above configured threshold should trigger faster assignment

24.5 Module: CRM Intelligence Sync

Purpose

Map structured lead intelligence into CRM and trigger workflow.

Inputs

lead identity data

discovered commercial fields

scores

recommendations

ownership logic

Core Functions

create new lead

update existing lead

write structured fields

create tasks

assign owner

tag SLA priority

attach discovery summary

log recommendations and missing data

Outputs

CRM record

owner assignment

task queue entries

activity log

Business Rules

required lead fields must be validated before CRM sync

existing leads should be updated, not duplicated, where match confidence is sufficient

every CRM write must be auditable

24.6 Module: Sales Copilot

Purpose

Support salespeople in live discovery, qualification, and next-step planning.

Inputs

CRM lead state

discovery engine output

score output

solution recommendations

Core Functions

display lead understanding

display missing fields

suggest next questions live

show recommended pitch angle

show case studies and risks

show proposal readiness

Outputs

salesperson guidance

improved discovery quality

faster handoff to proposal stage

Business Rules

salesperson must be able to override system suggestions

overrides must be logged with reason if they change major fields or recommendations

24.7 Module: Discovery Chatbot

Purpose

Run external prospect qualification in a structured but conversational way.

Inputs

prospect messages

channel context

discovery logic

known company/contact data

Core Functions

greet and classify inquiry

ask next-best question

maintain state across turns

summarize requirement

sync to CRM

hand off to human when appropriate

Outputs

structured lead brief

handoff summary

live lead score

Business Rules

no repetitive questions

do not request unnecessary information

escalate when prospect asks for commitments outside approved scope

preserve context across channel turns where technically possible

24.8 Module: Founder Review & Override

Purpose

Allow high-value or low-confidence leads to be reviewed and corrected by founder/sales head.

Inputs

lead summary

score

confidence status

escalation reason

system recommendation

Core Functions

show escalation context

allow approval/edit/override

log override reason

write override back into system

feed override into learning loop

Outputs

final approved direction

learning signal

updated CRM and recommendation state

Business Rules

all overrides must be logged

override should distinguish between pricing correction, service correction, discovery correction, or routing correction

24.9 Module: Learning & Evaluation Layer

Purpose

Improve the brain over time through outcomes and review.

Inputs

lead outcomes

win/loss reasons

override logs

question quality ratings

recommendation accuracy reviews

Core Functions

track performance by module

identify failure patterns

identify weak questions

identify weak scoring rules

support review cycles

suggest updates to knowledge logic

Outputs

evaluation dashboards

quality reports

update recommendations

Business Rules

only approved logic updates should affect production behavior

historical outcomes should remain linked to the version used at the time

25. User Stories

25.1 Sales Executive

As a sales executive, I want to see the missing information for a lead so that I know what to ask next.

As a sales executive, I want the system to suggest relevant questions during a call so that I can conduct better discovery.

As a sales executive, I want to know whether the lead is ready for proposal so that I do not waste time preparing incomplete quotes.

As a sales executive, I want the system to suggest the right service mix so that I can pitch confidently.

As a sales executive, I want case study recommendations relevant to the lead so that I can strengthen my conversation.

25.2 Sales Head

As a sales head, I want high-intent leads to be prioritized automatically so that the team focuses on the right opportunities.

As a sales head, I want low-confidence but high-value leads to be escalated so that important opportunities are not mishandled.

As a sales head, I want to review scoring logic and override patterns so that I can improve sales quality.

25.3 Founder

As a founder, I want the system to capture my commercial reasoning in structured form so that the company can scale beyond founder dependency.

As a founder, I want to review escalated leads with complete context so that I can intervene quickly and effectively.

As a founder, I want overrides to improve the system so that repeated corrections reduce over time.

25.4 Operations Manager

As an operations manager, I want the sales handoff to include clear deliverables, assumptions, and risks so that execution planning is accurate.

As an operations manager, I want feasibility-sensitive leads to be flagged early so that sales does not overpromise.

25.5 CRM Admin

As a CRM admin, I want structured field mapping from conversations so that lead records remain clean and useful.

As a CRM admin, I want duplicate lead checks before sync so that the CRM stays reliable.

25.6 External Prospect

As a prospect, I want the chatbot to ask relevant questions without repetition so that the experience feels intelligent and professional.

As a prospect, I want the system to understand my requirement before transferring me to a salesperson so that I do not have to repeat myself.

26. Acceptance Criteria

26.1 Knowledge Core

Admin can create, edit, archive, and version services.

Admin can attach mandatory discovery fields to each active service.

Admin can map each question to a field or decision purpose.

Archived service logic is not used in new live recommendations.

26.2 Discovery Engine

System does not ask a field-confirming question again unless clarification is needed.

System selects questions based on service, industry, stage, and missing critical fields.

System marks each important field as confirmed, inferred, missing, or not applicable.

System can indicate when sufficient information exists for the next stage.

26.3 Solution Mapper

System provides at least one recommended solution path when minimum discovery threshold is met.

System includes risk flags when feasibility-related data is weak or missing.

System does not generate solution recommendations using inactive services.

26.4 FitScore Engine

System calculates and stores component-wise score breakdown.

System assigns lead band based on configured thresholds.

System recalculates score when critical new answers are added.

26.5 CRM Intelligence Sync

System can create a new lead with required structured fields.

System can update an existing lead without creating duplicates where match logic is satisfied.

Every CRM write action is logged with timestamp and source.

26.6 Sales Copilot

Sales user can see known fields, missing fields, score, and next-best questions in one view.

Sales user can submit an override to system suggestions.

Override reason is stored for review when major changes are made.

26.7 Discovery Chatbot

Bot can maintain context across at least one multi-turn discovery flow.

Bot avoids duplicate questions within the same conversation.

Bot can produce a structured lead summary before human handoff.

Bot can hand off to human when low confidence or out-of-scope request is detected.

26.8 Founder Review

Escalated lead shows score, confidence, summary, risks, and recommendation in one place.

Founder can approve, edit, or override system recommendation.

Override is recorded and sent to learning layer.

26.9 Learning Layer

System stores lead outcome and override events.

System can report question quality and recommendation accuracy trends.

Logic updates require approval before being activated in production.

27. Screen-wise Requirements

27.1 Screen: Lead Intelligence Dashboard

Must Display

lead profile header

company/contact details

source channel

service classification

score breakdown

confidence indicator

proposal readiness status

missing information list

recommended next action

Actions

open discovery panel

assign owner

escalate for review

sync/update CRM

open related case studies

27.2 Screen: Live Discovery Assistant

Must Display

current conversation transcript or notes

questions already asked

next-best question suggestions

field status tracker

answer capture inputs

Actions

mark answer as confirmed

edit inferred values

skip question with reason

request founder review

27.3 Screen: Solution Recommendation Panel

Must Display

recommended service mix

recommended touchpoints

estimated budget band

estimated timeline band

case study suggestions

assumptions

risks and exclusions

Actions

accept recommendation

choose alternative recommendation

send to proposal stage

escalate

27.4 Screen: Founder Review Panel

Must Display

escalation reason

system summary

system score

confidence status

recommendation

override history if any

Actions

approve

edit fields

override recommendation

change owner

send feedback to system

27.5 Screen: Knowledge Admin Panel

Must Display

list of services

list of industries

list of question banks

version history

active/inactive status

Actions

add/edit/archive entries

change question conditions

upload case studies

publish new version

28. Workflow State Definitions

30. Release Plan by Sprint Theme

Sprint Theme 1

finalize data model

finalize service taxonomy

finalize question bank framework

Sprint Theme 2

build knowledge admin layer

build service and industry records

build field-state model

Sprint Theme 3

build discovery engine logic

build next-best question selector

build scoring engine

Sprint Theme 4

build lead intelligence dashboard

build sales copilot interface

build CRM sync

Sprint Theme 5

founder review workflow

override logging

evaluation dashboard basics

Sprint Theme 6

external discovery bot beta

handoff summary generation

pilot testing with selected inbound channels

31. Recommended Next Deliverables

The next documents to create after this functional specification are: 1. Detailed CRM field mapping sheet 2. Service taxonomy sheet 3. Discovery question matrix by service and industry 4. Scoring model configuration sheet 5. Wireframes for dashboard, copilot, and founder review screens 6. API contract and event schema 7. Pilot rollout plan with ownership and milestones

32. Detailed CRM Field Mapping Sheet

This section defines the recommended CRM field structure for AIM Entity Brain.

The objective is to ensure that every discovery conversation produces: - clean structured CRM data - commercially useful lead records - reliable routing and prioritization - proposal-readiness visibility - auditability of inferred vs confirmed information

Field Design Principles

Every critical commercial field must have a clear source.

Important fields should distinguish between confirmed and inferred values.

Fields should support both human entry and AI-generated updates.

CRM fields must support downstream actions such as assignment, SLA, proposal preparation, and escalation.

Free-text notes should not replace structured fields for core qualification data.

32.1 Lead Identity Fields

32.2 Company Intelligence Fields

32.3 Contact Authority Fields

Recommended Decision Maker Status Values

Final Decision Maker

Strong Influencer

Evaluator / Researcher

Procurement Only

Agency Intermediary

Unknown

32.4 Requirement Classification Fields

Recommended Inquiry Type Values

New Requirement

Repeat Requirement

Capability Check

Budgetary Exploration

Proposal Follow-up

Partnership Inquiry

Vendor Registration

32.5 Timeline and Volume Fields

Recommended Timeline Urgency Values

Immediate (0–7 days)

Within 30 Days

Within Quarter

Exploratory / No Fixed Timeline

32.6 Budget and Commercial Fields

Recommended Budget Band Values

Below 1L

1L–3L

3L–10L

10L–25L

25L+

Unknown

32.7 Qualification and Discovery Fields

Recommended Proposal Readiness Values

Not Ready

Ready for Capability Deck

Ready for Budgetary Estimate

Ready for Scoped Proposal

Needs Human Review

32.8 Scoring Fields

Recommended Lead Priority Bands

High Intent Priority

Qualified Priority

Nurture / Clarify

Low Priority

Disqualify

32.9 Routing and Ownership Fields

Recommended Next Action Values

Schedule Discovery Call

Send Capability Deck

Send Budgetary Estimate

Prepare Proposal

Founder Review

Nurture

Disqualify

32.10 Solution Recommendation Fields

32.11 Channel Conversation Fields

32.12 Audit and Learning Fields

32.13 Required Minimum Field Set by Stage

Stage: New Lead

Required minimum: - lead_id - company_name or phone/email - source_channel - lead_origin_type - first_contact_timestamp

Stage: Discovery In Progress

Required minimum: - service_category - industry_primary - requirement_summary - discovery_stage - requirement_completeness_score - next_best_question

Stage: Qualified / Assigned

Required minimum: - total_lead_score - lead_priority_band - recommended_owner_team - SLA_priority - proposal_readiness_status - missing_information_summary

Stage: Proposal Ready

Required minimum: - service_category - sub_service_category (if known) - campaign_objective_primary - target_geography - timeline_urgency_band - budget_band - proposal_readiness_status - assumptions - risk_flags

32.14 Field Source Hierarchy

When multiple sources provide values, use this order unless manually overridden: 1. Human-confirmed user input 2. Founder / sales head override 3. Salesperson confirmed entry 4. Reliable system enrichment 5. AI inference

Rule

If AI inference conflicts with human-confirmed data, human-confirmed data wins.

32.15 Recommended CRM Object Structure

Lead Object

Stores primary lead identity and qualification state.

Account Object

Stores company-level long-term information.

Contact Object

Stores contact-level person details.

Opportunity Object

Created when lead reaches commercial seriousness threshold.

Activity Object

Stores calls, chats, emails, tasks, and follow-up actions.

Intelligence Snapshot Object

Stores AI-generated summary, scores, recommendation, assumptions, and confidence state for each major interaction cycle.

32.16 Recommended System Events

lead.created

lead.updated

discovery.started

discovery.answer.captured

discovery.completed

score.updated

owner.assigned

escalation.triggered

proposal.readiness.changed

founder.override.created

outcome.recorded

These events will help product and engineering maintain auditability and workflow automation.

32.17 Implementation Notes

Use structured enums wherever possible for routing-critical fields.

Keep requirement_summary, missing_information_summary, assumptions, and risk_flags as generated long-text fields, but do not depend only on them.

Preserve all major AI writes with timestamps and version metadata.

Keep score components stored separately, not just the total score.

Ensure duplicate detection uses phone, email, company, and source-side identifiers where available.

Make proposal_readiness_status and quote_readiness_status separate fields.

Every field updated by AI should carry a traceable source or origin in the data_origin_map.

32.18 Recommended Next Document

After this CRM mapping sheet, the next most important document is: Service Taxonomy + Discovery Question Matrix by Service and Industry

That will define exactly what AIM sells, where it fits, and what the system must ask before recommending or quoting.

33. Service Taxonomy Sheet

This section defines the recommended AIM service taxonomy for the first production version of the Entity Brain.

The purpose of this taxonomy is to ensure that the system can: - classify inquiries correctly - understand service fit and misfit - know what information is required before quoting - know what information is required before feasibility confirmation - map requirements into the correct commercial path

Taxonomy Design Principles

Start with a limited number of commercially meaningful service categories.

Separate service categories from touchpoints.

Distinguish quote inputs from feasibility inputs.

Define misfit cases clearly so the system knows when not to push a service.

Ensure each active service has at least one discovery path and one proposal path.

33.1 AIM Core Service Categories

Level 1 Categories

Product Sampling

On-Ground Brand Activation

Retail / In-Store Branding

Transit / Mobile Outreach

Residential Community Outreach

Corporate / Workplace Outreach

College / Youth Outreach

Fitness / Lifestyle Outreach

Mall / Public Venue Activation

Hybrid Campaign Solutions

Notes

Some categories are solution categories.

Some are execution environment categories.

For the Entity Brain, this is acceptable as long as the system clearly maps service logic and touchpoint logic separately.

33.2 Service Taxonomy Table

33.3 Detailed Service Definitions

33.3.1 Product Sampling

Description

AIM executes controlled product trial campaigns across selected touchpoints to drive awareness, trial, and in some cases conversion or attribution.

Primary Use Cases

product launches

new market entry

consumer trial

sell-out support

brand awareness with sampling

trial-to-conversion campaigns

Typical Industries

FMCG

beauty and skincare

personal care

wellness and nutrition

beverages and food

baby care

pet care

menstrual hygiene

Core Deliverables

touchpoint planning

promoter deployment

sample distribution

interaction or engagement execution

reporting and proof of execution

optional feedback capture

optional redemption or conversion-linked mechanism

Mandatory Quote Inputs

product category

city/cities

target audience

planned scale or sample volume

desired timeline

preferred touchpoints

Mandatory Feasibility Inputs

permission dependency

sample handling/storage constraints

staff requirement

venue access model

activation hours or timing restrictions

Common Risks

unclear target audience

unrealistic timeline

mismatch between brand and touchpoint

insufficient permissions lead time

no clarity on sample volume

33.3.2 On-Ground Brand Activation

Description

AIM creates interactive brand experiences to drive engagement, education, recall, and trial.

Primary Use Cases

new launches

experiential engagement

product demonstration

lead generation in physical environments

recall campaigns

Typical Industries

consumer brands

personal care

wellness

FMCG

electronics and appliance retail tie-ins

Mandatory Quote Inputs

venue type

activation objective

duration

branding scope

promoter/staffing expectation

Mandatory Feasibility Inputs

space availability

fabrication requirements

venue permissions

power or display requirements

safety or compliance restrictions

33.3.3 Retail / In-Store Branding

Description

AIM executes store-level visual branding and shopper visibility solutions.

Primary Use Cases

retail launch visibility

store branding rollout

shelf impact improvement

shopper conversion support

Mandatory Quote Inputs

store count

city/cities

element types required

quantity per store

execution timeline

Mandatory Feasibility Inputs

store measurement availability

retailer approvals

material specifications

installation windows

access conditions

33.3.4 Transit / Mobile Outreach

Description

AIM executes route-based, vehicle-based, or transit-facing brand visibility campaigns.

Primary Use Cases

awareness campaigns

launch buzz

route-based reach

hyperlocal visibility

Mandatory Quote Inputs

city

vehicle type

duration

quantity

date range

Mandatory Feasibility Inputs

inventory availability

local permissions

route constraints

branding production lead time

33.3.5 Hybrid Campaign Solutions

Description

AIM combines multiple touchpoints under one campaign objective for broader relevance and reach.

Primary Use Cases

multi-audience launch

pilot + scale rollout

integrated visibility + trial campaign

category education across multiple environments

Mandatory Quote Inputs

campaign objective

target segments

geography

budget band

timeline

Mandatory Feasibility Inputs

cross-touchpoint ops readiness

permissions dependency map

staffing availability

reporting framework needs

33.4 Industry Fit Notes

33.5 Service Misfit Logic

The Entity Brain should explicitly disqualify or deprioritize opportunities when any of the below are true: - the requested touchpoint does not match the target audience - the lead wants a firm quote without minimum commercial information - timeline is too short relative to permission and ops dependencies - product category is incompatible with venue or audience - stated budget is far below realistic threshold and client shows no flexibility - client expectation depends on outcomes not reasonably controllable by the service - there is no viable permission or access route

34. Discovery Question Matrix by Service and Industry

This matrix defines what the Entity Brain should ask before recommending, scoring, routing, or quoting.

Matrix Design Principles

Questions must have a purpose.

Questions must map to a field or decision.

The system should distinguish must-ask from nice-to-have.

The system should know which question affects quote, feasibility, score, or case-study selection.

The system should not ask the same question in multiple ways unless clarification is needed.

Question Type Tags

Must Ask = essential for qualification or solutioning

Quote Critical = required before meaningful budgetary estimate or proposal

Feasibility Critical = required before delivery confidence

Scoring Critical = affects lead quality or routing

Optional Depth = helpful, not mandatory in first pass

34.1 Universal Discovery Core Questions

These questions apply to almost all services.

34.2 Product Sampling — Core Discovery Matrix

34.3 IT Park Sampling — Service-Specific Questions

34.4 RWA / Apartment Sampling — Service-Specific Questions

34.5 Mall Sampling / Mall Activation — Service-Specific Questions

34.6 In-Store / Retail Sampling — Service-Specific Questions

34.7 College / Youth Sampling — Service-Specific Questions

34.8 Gym / Fitness Sampling — Service-Specific Questions

34.9 Brand Activation / Kiosk — Service-Specific Questions

34.10 Retail / In-Store Branding — Service-Specific Questions

34.11 LED Van / Mobile Outreach — Service-Specific Questions

34.12 Hybrid / Multi-Touchpoint Campaign — Service-Specific Questions

34.13 Industry-Specific Question Add-Ons

FMCG / Foods / Snacks

Beauty / Skincare / Personal Care

Wellness / Nutrition

Baby Care

Menstrual Hygiene

Pet Care

34.14 Question Priority Rules

The Entity Brain should use the following order when choosing the next question: 1. Questions required to understand objective and audience 2. Questions required to identify service fit 3. Questions required to assess timeline and feasibility 4. Questions required to understand scale and budget 5. Questions required to refine proposal quality 6. Optional depth questions only after the above are sufficiently answered

34.15 Stop Rules for Discovery

Discovery should pause and route to the next stage when: - objective is known - target audience is known - geography is known - probable service fit is known - timeline is known at least in band form - budget is known or reasonably inferred for next step - critical feasibility blockers are either known or flagged

If these are not available, the system should not mark the lead as proposal-ready.

34.16 Escalation Rules During Discovery

Escalate to founder or sales head when: - high-value brand but very low confidence - requirement spans multiple service categories with unclear commercial priority - prospect requests final pricing too early without critical data - service fit is ambiguous or appears weak - feasibility risk is high due to timeline, permissions, or category sensitivity - the prospect is a strategic account or marquee brand

34.17 Recommended Next Document

After this Service Taxonomy and Discovery Matrix, the next strongest document is: Scoring Configuration Sheet + Wireframes for Lead Intelligence Dashboard and Live Discovery Assistant

That will convert the logic into usable system behavior and UI structure.

35. Scoring Configuration Sheet

This section defines the detailed scoring logic for AIM Entity Brain.

The purpose of the scoring model is to help AIM: - prioritize the right leads quickly - reduce effort spent on low-fit opportunities - route leads to the right salesperson or escalation path - create a consistent commercial qualification standard across the team - separate exciting leads from actually viable leads

Scoring Design Principles

Score for commercial quality, not just surface interest.

Keep component scores visible; never rely only on one total score.

Distinguish lead attractiveness from execution feasibility.

Penalize missing critical data through completeness and confidence.

Allow founder override, but record it as a learning signal.

35.1 Scoring Model Overview

Total Score = 100

35.2 Fit Score Configuration (0–25)

Objective

Measure how well the lead’s need matches AIM’s services, execution models, and target categories.

Negative Adjustments

Guidance

20–25 = strong fit

14–19 = moderate fit

8–13 = weak fit

below 8 = poor fit or probable misfit

35.3 Authority Score Configuration (0–15)

Objective

Measure whether AIM is speaking to someone who can influence or close the buying decision.

Positive Modifiers

Cap Rule

Authority Score cannot exceed 15.

35.4 Urgency Score Configuration (0–15)

Objective

Measure how time-bound and sales-actionable the opportunity is.

Negative Adjustments

Guidance

Urgency should not overpower feasibility. A rushed but impossible lead is not high-quality.

35.5 Budget Score Configuration (0–15)

Objective

Measure commercial seriousness and likely budget alignment with the probable solution.

Positive Modifiers

Negative Adjustments

Cap Rule

Budget Score cannot exceed 15.

35.6 Completeness Score Configuration (0–10)

Objective

Measure whether enough commercial information exists for meaningful next action.

Critical Fields Considered

service category

campaign objective

target audience

target geography

timeline

scale or sample volume

decision maker status

budget band or budget orientation

Rules

inferred fields contribute less than confirmed fields when calculating completeness confidence

if service category is unknown, completeness cannot exceed 4

if objective is unknown, completeness cannot exceed 5

35.7 Strategic Value Score Configuration (0–10)

Objective

Measure longer-term business value beyond immediate project size.

Rules

Strategic value can increase priority, but cannot override severe feasibility issues.

35.8 Feasibility Score Configuration (0–10)

Objective

Measure whether AIM can realistically execute the requirement as discussed.

Negative Adjustments

Guidance

8–10 = strong feasibility

5–7 = feasible with caution

2–4 = weak feasibility

0–1 = likely not feasible without major clarification

35.9 Confidence Score Configuration (0–100)

Confidence is separate from lead quality.

Objective

Measure how reliable the system’s understanding and recommendations are.

Confidence Inputs

Confidence Bands

80–100 = High Confidence

60–79 = Medium Confidence

Below 60 = Low Confidence

Rules

high-value leads with low confidence should escalate

low confidence should suppress premature proposal-ready status

confidence should drop when fields are contradictory or mostly inferred

35.10 Lead Priority Band Logic

35.11 Routing Rules by Score and Confidence

35.12 SLA Recommendation Rules

35.13 Proposal Readiness Rules Based on Score + Completeness

A lead may be marked:

Ready for Capability Deck

If: - objective known - probable service fit known - target audience known - geography known

Ready for Budgetary Estimate

If: - above capability deck conditions met - timeline band known - scale band or rough volume known - budget orientation known or pilot openness exists

Ready for Scoped Proposal

If: - service/sub-service reasonably clear - geography clear - objective clear - timeline clear - scale clear - budget band known or commercial path agreed - feasibility risk not high - confidence at least medium

Needs Human Review

If: - high value but low confidence - ambiguous service fit - high-risk feasibility - client insists on final quote too early

35.14 Escalation Trigger Rules

Escalate when any of the following is true: - total score >= 80 and confidence < 60 - strategic value score >= 8 and service fit is ambiguous - feasibility score <= 3 but urgency score >= 10 - budget mismatch severe but brand value is high - opportunity spans multiple service lines with unclear primary path - prospect is a marquee account, key founder connection, or board-level contact

35.15 Example Scoring Scenarios

Example A: Strong Skincare Launch Lead

brand manager from known beauty brand

wants Bangalore IT park + mall trial campaign

launch within 30 days

decent budget band disclosed

target audience clear

scale reasonably known

Suggested score: - Fit: 22 - Authority: 11 - Urgency: 12 - Budget: 12 - Completeness: 8 - Strategic: 7 - Feasibility: 7 - Total: 79 - Confidence: 82

Routing: standard qualified priority with fast assignment.

Example B: Marquee Brand, Vague Brief

well-known FMCG brand

asks for “something impactful pan-India”

no budget, no specific audience, no timeline clarity

contact is mid-level marketing executive

Suggested score: - Fit: 15 - Authority: 8 - Urgency: 4 - Budget: 3 - Completeness: 3 - Strategic: 9 - Feasibility: 3 - Total: 45 - Confidence: 42

Routing: founder/sales head review because strategic value is high but clarity is poor.

Example C: Low-Budget Misfit Lead

unknown brand

asks for premium mall activation in multiple cities

budget extremely low and fixed

wants final quote immediately

Suggested score: - Fit: 8 - Authority: 6 - Urgency: 9 - Budget: 1 - Completeness: 5 - Strategic: 2 - Feasibility: 2 - Total: 33 - Confidence: 68

Routing: low priority or disqualify unless client agrees to re-scope.

35.16 Override Rules

Human override should be allowed for: - score correction - strategic value correction - authority correction - feasibility reassessment - routing reassignment

Override Logging Must Capture

who overrode

what changed

why it changed

date/time

logic version originally used

35.17 Recommended Configurability

The following should be admin-configurable: - point values by score band - routing thresholds - SLA thresholds - escalation triggers - strategic account rules - service-specific penalties - proposal readiness gates

35.18 Recommended Next UI Behavior Tied to Scoring

show component scores, not only total score

visually highlight missing critical fields that are reducing score/confidence

display why a score was assigned in plain language

allow human edit for corrected data before score recalculation

clearly show when a high-value lead is being escalated because of low confidence

36. Wireframe Requirements

This section defines the UI structure for the first product version.

The aim is not visual design polish yet. The aim is to make the product buildable by defining the screen structure, information hierarchy, and primary actions.

36.1 Screen: Lead Intelligence Dashboard

Goal

Give sales and leadership a single-pane commercial view of a lead.

Main Sections

Lead Header

Qualification Snapshot

Score and Confidence Panel

Requirement Summary

Missing Information

Recommended Next Step

Solution Recommendation

Case Study Suggestions

Activity Timeline

Layout Suggestion

Left column: lead identity, contact info, company info

Center column: requirement summary, missing data, next questions

Right column: scores, routing, confidence, proposal readiness, escalation flags

Fields to Show

company name

contact name and designation

source channel

service category

sub-service category

industry

target audience summary

geography

timeline band

budget band

total score

component scores

confidence band

proposal readiness

assigned owner

escalation/founder review flag

Key Actions

assign owner

open live discovery assistant

mark as escalate

view recommended case studies

open CRM record

move to proposal stage

log override

Acceptance Criteria

user can understand lead quality in under 30 seconds

user can identify missing critical data without opening another screen

score and confidence are visible at first glance

36.2 Screen: Live Discovery Assistant

Goal

Help salesperson or bot run structured discovery without repetition.

Main Sections

Conversation Stream / Notes

Field Status Tracker

Next-Best Question Suggestions

Captured Answers

Recommendation Preview

Quick Actions

Layout Suggestion

Left panel: transcript or conversation notes

Center panel: structured answer cards and next question suggestions

Right panel: field status, score changes, confidence changes, proposal readiness

Fields to Show

asked questions

skipped questions and reasons

confirmed fields

inferred fields

missing critical fields

next-best questions

current score snapshot

confidence snapshot

Key Actions

ask suggested question

mark answer confirmed

edit field manually

skip question with reason

request founder review

recalculate score

generate summary

Acceptance Criteria

system does not repeat confirmed questions

user can see why the next question is being suggested

score updates after major answer capture

36.3 Screen: Solution Recommendation Panel

Goal

Show the recommended commercial path clearly and explain why it fits.

Main Sections

Primary Recommendation

Alternative Recommendation(s)

Why This Fits

Budget and Timeline Guidance

Risks and Assumptions

Supporting Case Studies

Fields to Show

recommended service mix

recommended touchpoint mix

campaign model (pilot / rollout)

budget band

timeline band

assumptions

exclusions

risks

case study links

Key Actions

accept recommendation

compare alternatives

send to proposal prep

escalate for human review

Acceptance Criteria

user can distinguish recommendation from assumption

user can see at least one reason behind each recommendation

unsupported inactive services are never shown

36.4 Screen: Founder Review Panel

Goal

Allow founder or sales head to quickly correct, approve, or redirect important leads.

Main Sections

Escalation Summary

Lead Snapshot

System Recommendation

Risk / Confidence Indicators

Override Controls

Change Log

Fields to Show

escalation reason

total score and confidence

strategic value score

feasibility score

discovery summary

missing information

recommendation

prior overrides if any

Key Actions

approve recommendation

edit fields

change owner

force proposal stage

mark nurture/disqualify

submit override reason

Acceptance Criteria

founder can make a decision in under 2 minutes for normal escalations

all overrides are logged with reason

system recommendation remains visible alongside override

36.5 Screen: Knowledge Admin Panel

Goal

Allow admin or product team to maintain service logic and question logic.

Main Sections

Services

Industries

Question Banks

Scoring Config

Version History

Case Study Tags

Key Actions

create/edit/archive service

update question conditions

update scoring thresholds

activate new version

rollback version if needed

Acceptance Criteria

admin can update active logic without breaking historical records

version history is visible and searchable

only approved users can publish logic changes

36.6 Cross-Screen Design Requirements

Required Global UI Elements

lead score chip

confidence chip

proposal readiness chip

source channel badge

escalation badge

last updated timestamp

logic version indicator

Required Behaviors

every important AI-generated field should be traceable

human-edited fields should show override marker

screen should clearly separate confirmed vs inferred data

critical missing fields should be visually highlighted

36.7 Recommended Prototype Order

Build wireframes/prototypes in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel

This order matches the sequence of highest business value for AIM.

36.8 Recommended Next Document

After this scoring sheet and wireframe spec, the next most useful document is: API Contract + Event Schema + Pilot Rollout Plan

That will give engineering integration clarity and give leadership a phased implementation path.

37. API Contract Specification

This section defines the recommended API surface for AIM Entity Brain.

The API layer should support: - lead intake - discovery progression - scoring - recommendation generation - CRM sync - founder override - analytics and audit retrieval

API Design Principles

Keep business objects explicit and versioned.

Separate synchronous response APIs from event-driven workflow updates.

Ensure all AI-generated outputs can be traced to model version and logic version.

Use structured request and response bodies.

Keep human override endpoints first-class, not as afterthoughts.

Base Objects

Lead

Discovery Session

Discovery Answer

Score Snapshot

Recommendation Snapshot

CRM Sync Result

Override Record

Outcome Record

Knowledge Version

37.1 API Authentication and Access Model

Recommended Access Types

Internal Service Token for backend-to-backend integrations

Role-based User Auth for admin, sales, founder, ops, CRM admin

Channel Auth for website bot, WhatsApp connector, and later voice stack

Recommended Roles

Admin

Sales User

Sales Head

Founder Reviewer

Ops User

CRM Admin

Read-Only Analytics User

Authorization Rules

Sales users can read and update assigned leads and discovery sessions

Founders and sales heads can override recommendations and scores

Admins can update knowledge logic, scoring thresholds, and service records

CRM Admins can manage sync configuration and duplicate detection rules

37.2 Lead Intake API

Endpoint

POST /api/v1/leads/intake

Purpose

Create or update an incoming lead from website, WhatsApp, email, phone, or manual entry.

Request Body

{
"source_channel": "website",
"lead_origin_type": "inbound",
"company_name": "Example Brand",
"contact_name": "Priya Sharma",
"designation": "Brand Manager",
"email": "priya@example.com",
"phone": "+919999999999",
"raw_message": "We want to do a skincare sampling campaign in Bangalore.",
"campaign_source": "google_ads",

"campaign_medium": "cpc",

"campaign_name": "sampling_q2"

}

Response Body

{

"lead_id": "LD-000124",

"matched_existing_lead": false,

"discovery_session_id": "DS-00987",

"classification_status": "pending",

"message": "Lead intake successful"

}

Rules

duplicate detection should run before creating a new lead

if confidence of duplicate match is high, update existing lead instead of creating new one

raw inbound message should be stored separately from structured summary

37.3 Lead Classification API

Endpoint

POST /api/v1/leads/{lead_id}/classify

Purpose

Classify service category, industry, probable objective, and priority context from existing lead data.

Response Body

{

"lead_id": "LD-000124",

"industry_primary": "Beauty / Skincare",

"service_category": "Product Sampling",

"sub_service_category": "IT Park Sampling",

"campaign_objective_primary": "Product Trial",

"confidence_score": 74,

"logic_version_used": "v1.0.3",

"model_version_used": "gpt-x.x"

}

Rules

classification should always preserve confidence and origin metadata

if classification confidence is low, discovery should remain broad until clarified

37.4 Discovery Session Create API

Endpoint

POST /api/v1/discovery-sessions

Purpose

Create a structured discovery session tied to a lead.

Request Body

{
"lead_id": "LD-000124",
"channel": "sales_copilot",
"initiated_by": "sales_user_17"
}

Response Body

{
"discovery_session_id": "DS-00987",
"lead_id": "LD-000124",
"status": "active"
}

37.5 Next-Best Question API

Endpoint

GET /api/v1/discovery-sessions/{discovery_session_id}/next-question

Purpose

Return the most relevant next question based on current field state.

Response Body

{
"question_id": "Q-112",
"question_text": "Approximately how many samples are you planning to deploy in phase 1?",
"question_type": "Quote Critical",
"reason": "Sample volume is required to estimate campaign scope and budget band.",
"field_to_populate": "sample_volume_estimate",
"priority": 1
}

Rules

must not return a question already confirmed unless clarification flag exists

should include plain-language reason so the salesperson understands why it matters

37.6 Discovery Answer Capture API

Endpoint

POST /api/v1/discovery-sessions/{discovery_session_id}/answers

Purpose

Capture a prospect answer and update structured fields.

Request Body

{

"question_id": "Q-112",

"answer_text": "We are planning around 10,000 units for the first phase.",

"captured_by": "sales_user_17",

"answer_source": "human_entered"

}

Response Body

{

"lead_id": "LD-000124",

"updated_fields": [

{

"field": "sample_volume_estimate",

"value": 10000,

"status": "confirmed"

}

],

"score_recalculated": true,

"proposal_readiness_status": "Ready for Budgetary Estimate"

}

Rules

every captured answer should generate field updates, audit records, and optional score recalculation

AI-normalized values should preserve original answer text for traceability

37.7 Discovery Summary API

Endpoint

GET /api/v1/leads/{lead_id}/discovery-summary

Purpose

Return a structured summary of all known, inferred, and missing commercial information.

Response Body

{

"lead_id": "LD-000124",

"summary": "Beauty brand exploring Bangalore IT park sampling for skincare launch within 30 days.",

"confirmed_fields": {

"industry_primary": "Beauty / Skincare",

"service_category": "Product Sampling",

"sample_volume_estimate": 10000

},

"inferred_fields": {

"budget_band": "3L–10L"

},

"missing_fields": [

"exact touchpoint split",

"branding scope"

]

}

37.8 Score Calculation API

Endpoint

POST /api/v1/leads/{lead_id}/score

Purpose

Recalculate all component scores and total lead score.

Response Body

{

"lead_id": "LD-000124",

"fit_score": 22,

"authority_score": 11,

"urgency_score": 12,

"budget_score": 10,

"completeness_score": 8,

"strategic_value_score": 6,

"feasibility_score": 7,

"total_lead_score": 76,

"lead_priority_band": "Qualified Priority",

"confidence_score": 81,

"confidence_band": "High"

}

Rules

every scoring response must include component-level outputs

score recalculation should happen automatically after critical field changes and optionally on demand

37.9 Recommendation API

Endpoint

POST /api/v1/leads/{lead_id}/recommendation

Purpose

Generate service, touchpoint, and next-step recommendation.

Response Body

{

"lead_id": "LD-000124",

"recommended_service_mix": [

"IT Park Sampling",

"Mall Sampling"

],

"recommended_campaign_model": "Pilot",

"budget_band": "3L–10L",

"timeline_band": "Within 30 Days",

"recommended_case_studies": [

"CS-101",

"CS-117"

],

"risks": [

"Branding scope not yet defined"

],

"assumptions": [

"Single-city phase 1"

]

}

Rules

should not generate unsupported service recommendations

must preserve assumptions explicitly

low confidence recommendations should include human review flag

37.10 Proposal Readiness API

Endpoint

GET /api/v1/leads/{lead_id}/proposal-readiness

Purpose

Return readiness status for capability deck, budgetary estimate, or scoped proposal.

Response Body

```
{
"lead_id": "LD-000124",
"proposal_readiness_status": "Ready for Budgetary Estimate",
"quote_readiness_status": "Needs More Discovery",
"missing_critical_fields": [
"branding scope"
],
"recommended_next_action": "Clarify branding requirement before final proposal"
}
```

37.11 CRM Sync API

Endpoint

POST /api/v1/leads/{lead_id}/sync-crm

Purpose

Push or update lead intelligence in CRM.

Response Body

```
{
"lead_id": "LD-000124",
"crm_record_id": "CRM-77812",
"sync_status": "success",
"updated_fields_count": 21,
"owner_assigned": "Vidhya",
"sla_priority": "High"
}
```

Rules

all sync attempts should create audit records

CRM sync failures should create retryable system events

37.12 Founder Override API

Endpoint

POST /api/v1/leads/{lead_id}/override

Purpose

Allow founder or sales head to modify scores, routing, service recommendations, or readiness states.

Request Body

{

"override_type": "service_correction",

"changed_fields": {

"sub_service_category": "Mall Sampling"

},

"reason": "Better TG fit for premium skincare positioning",

"overridden_by": "founder_user_01"

}

Response Body

{

"lead_id": "LD-000124",

"override_record_id": "OV-6612",

"status": "applied",

"learning_signal_created": true

}

Rules

all overrides must capture before/after values and reason

override should trigger refreshed summary and optional re-score

37.13 Outcome Logging API

Endpoint

POST /api/v1/leads/{lead_id}/outcome

Purpose

Store win/loss and outcome reason for learning and analytics.

Request Body

{

"outcome_status": "won",

"outcome_reason": "Budget aligned and pilot approved",

"recorded_by": "sales_head_01"

}

37.14 Knowledge Management APIs

Recommended Endpoints

POST /api/v1/knowledge/services

PATCH /api/v1/knowledge/services/{service_id}

POST /api/v1/knowledge/questions

PATCH /api/v1/knowledge/questions/{question_id}

POST /api/v1/knowledge/industries

POST /api/v1/knowledge/case-studies

POST /api/v1/knowledge/versions/publish

POST /api/v1/knowledge/versions/rollback

Rules

only approved roles can publish new logic version

version metadata must be preserved on all production decisions

37.15 Analytics APIs

Recommended Endpoints

GET /api/v1/analytics/lead-quality

GET /api/v1/analytics/question-quality

GET /api/v1/analytics/override-patterns

GET /api/v1/analytics/conversion-by-score-band

GET /api/v1/analytics/discovery-completeness

37.16 Error Handling Standards

Common Error Types

validation_error

duplicate_lead_conflict

knowledge_version_not_found

low_confidence_block

crm_sync_failure

permission_denied

unsupported_service_path

Error Response Format

{

"error_code": "validation_error",

"message": "service_category is required for scoring",

"details": {

"field": "service_category"

}

}

38. Event Schema Specification

This section defines the event-driven model for AIM Entity Brain.

The event layer should power: - auditability - retries - analytics - downstream integrations - async workflow automation

Event Design Principles

Every material lead-state change should emit an event.

Events should be idempotent-friendly.

Events should include source, timestamp, lead ID, and version metadata.

Failure-prone external integrations should be event-driven where possible.

Standard Event Envelope

{

"event_id": "EV-90001",

"event_type": "lead.created",

"occurred_at": "2026-04-04T12:15:00Z",

"lead_id": "LD-000124",

"source": "website_bot",

"logic_version_used": "v1.0.3",

"model_version_used": "gpt-x.x",

"payload": {}

}

38.1 Core Lead Events

lead.created

When a new lead record is created.

lead.updated

When major lead data is updated.

lead.matched_existing

When intake resolves to an existing lead rather than creating a new one.

lead.assigned

When owner/team assignment occurs.

lead.escalated

When founder or sales-head review is triggered.

lead.disqualified

When lead is marked low-fit or unviable.

38.2 Discovery Events

discovery.started

When a discovery session begins.

discovery.question.served

When next-best question is generated and shown.

discovery.answer.captured

When an answer is stored.

discovery.field.updated

When a structured field changes.

discovery.summary.generated

When a summary is refreshed.

discovery.completed

When minimum discovery threshold is reached.

38.3 Scoring and Recommendation Events

score.calculated

When score snapshot is recalculated.

confidence.updated

When confidence changes materially.

recommendation.generated

When solution recommendation is produced.

proposal.readiness.changed

When readiness status changes.

38.4 CRM and Workflow Events

crm.sync.requested

When CRM sync is triggered.

crm.sync.succeeded

When CRM sync succeeds.

crm.sync.failed

When CRM sync fails.

task.created

When follow-up or review task is created.

sla.priority.changed

When SLA classification changes.

38.5 Human Review Events

override.created

When a founder or sales head override is submitted.

override.applied

When override has been written into active lead state.

review.approved

When escalation is approved without changes.

review.reassigned

When ownership or path is changed in review.

38.6 Learning and Outcome Events

outcome.recorded

When win/loss is captured.

analytics.snapshot.generated

When periodic analytics jobs are run.

knowledge.version.published

When new logic goes live.

knowledge.version.rolled_back

When version rollback happens.

38.7 Example Event Payloads

Example: score.calculated

{
"event_id": "EV-90002",
"event_type": "score.calculated",
"occurred_at": "2026-04-04T12:30:00Z",
"lead_id": "LD-000124",
"source": "scoring_engine",
"logic_version_used": "v1.0.3",
"payload": {
"fit_score": 22,
"authority_score": 11,
"urgency_score": 12,
"budget_score": 10,

"completeness_score": 8,
"strategic_value_score": 6,
"feasibility_score": 7,
"total_lead_score": 76,
"lead_priority_band": "Qualified Priority"
}
}

Example: lead.escalated

{
"event_id": "EV-90003",
"event_type": "lead.escalated",
"occurred_at": "2026-04-04T12:35:00Z",
"lead_id": "LD-000124",
"source": "orchestrator",
"payload": {
"reason": "High value but low confidence",
"recommended_reviewer_role": "Founder Reviewer"
}
}

38.8 Event Consumers

Recommended Consumers

CRM integration worker

analytics worker

notification service

founder review queue service

task creation service

audit log service

model evaluation pipeline

38.9 Retry and Failure Handling

Recommended Rules

CRM sync failures should retry with backoff

external messaging failures should be logged and retried separately

score/recommendation failures should not corrupt existing lead state

failed async consumers should push to dead-letter queue after retry threshold

39. Pilot Rollout Plan

This section defines how AIM should launch the first working version of Entity Brain.

The goal is not to automate everything at once. The goal is to prove business value safely and quickly.

Pilot Principles

Start with high-frequency, commercially important services.

Use internal sales copilot first.

Keep founder feedback tightly looped during the pilot.

Measure both system accuracy and business impact.

Expand only after question quality and routing quality stabilize.

39.1 Recommended Pilot Scope

Phase 1 Pilot Services

Start with the services that most directly affect AIM's current commercial motion: 1. Product Sampling - IT Park Sampling - RWA / Apartment Sampling - Mall Sampling - In-Store / Retail Sampling 2. Brand Activation - Kiosk-Based Activation - Product Demo / Trial Booth 3. Transit / Mobile Outreach - LED Van Campaign

Why These First

they are core to AIM's sales motion

they have repeatable commercial logic

they frequently require founder intervention today

they are good training ground for discovery quality

39.2 Recommended Pilot Users

Internal Users

1 Sales Head / reviewer

2 Sales users

1 Founder reviewer

1 Ops reviewer

1 Product / admin owner

Suggested AIM Pilot Roles

Sales Head: oversight and override review

Sales Users: primary copilot users during discovery

Founder: weekly quality review and escalations

Ops: feasibility validation feedback

Admin/Product: maintain knowledge updates and scoring thresholds

39.3 Recommended Pilot Channels

Start With

manual lead entry through sales copilot

website inbound leads summarized into system

WhatsApp inbound leads processed through structured intake

Defer Initially

fully autonomous public chatbot

voice outbound automation

automated proposal generation without review

39.4 Pilot Success Criteria

Operational Success Metrics

reduction in founder interruptions per lead

increase in discovery completeness score

reduction in average time to proposal readiness

reduction in missing critical fields at proposal stage

Quality Metrics

duplicate question rate below agreed threshold

score accuracy vs sales-head review

recommendation usefulness rating from sales team

feasibility flag accuracy from ops review

Commercial Metrics

improved lead prioritization quality

faster response on high-intent leads

improved proposal conversion on qualified leads

39.5 Pilot KPI Targets (Recommended Starting Benchmarks)

These can be tuned once AIM sets a baseline.

39.6 Pilot Rollout Stages

Stage 0: Preparation (Week 1–2)

finalize pilot services

finalize scoring thresholds

finalize question banks

finalize CRM field map

onboard pilot users

define feedback review cadence

Stage 1: Internal Copilot Shadow Mode (Week 3–4)

sales team continues normal process

system runs in parallel and suggests questions/scores

compare system suggestions against actual sales actions

log gaps and override patterns

Stage 2: Assisted Live Mode (Week 5–6)

sales team actively uses copilot during discovery

founder reviews escalated leads

ops validates feasibility flags

CRM sync used for pilot leads

Stage 3: Controlled Operational Mode (Week 7–8)

selected website and WhatsApp leads enter through system

discovery summaries auto-generated

scoring/routing used for working decisions

weekly logic tuning based on outcomes

Stage 4: Pilot Review and Expansion Decision (Week 9)

review business metrics

review override patterns

review question quality

review routing accuracy

decide go/no-go for discovery bot expansion

39.7 Pilot Governance Cadence

Daily

review sync failures

review escalations

review major overrides

Weekly

founder review of top escalations

sales feedback review

ops feedback review

scoring and question quality review

End of Pilot

compare baseline vs pilot performance

identify service gaps

finalize phase 2 expansion plan

39.8 Recommended Pilot Review Template

Each week, review: - number of pilot leads processed - score distribution - confidence distribution - average completeness score - number of escalations - number of overrides - most common missing fields - most common weak questions - most common misclassification issues - proposal-readiness accuracy - notable wins/losses

39.9 Expansion Criteria After Pilot

Expand to next phase only if: - discovery quality is stable - duplicate questioning is low - sales users trust the copilot - founder override rate is reducing meaningfully - CRM sync reliability is acceptable - recommendation usefulness is consistently positive

Phase 2 Expansion Candidates

more retail branding workflows

more hybrid campaign paths

customer-facing discovery bot

Phase 3 Expansion Candidates

voice prospecting engine

semi-automated outbound qualification

deeper proposal automation

39.10 Recommended Ownership Model

39.11 Recommended Next Document

After this implementation specification, the next best documents are: 1. Figma wireframes or clickable prototype for the key screens 2. Engineering task breakdown by module 3. Data migration / knowledge ingestion plan 4. Pilot operating SOP for sales and founder reviewers

These will take AIM from planning into active build execution.

40. Engineering Task Breakdown by Module

This section translates the product specification into executable workstreams for engineering, product, and operations.

The purpose of this breakdown is to help AIM: - estimate build effort - allocate ownership across backend, frontend, product, and integrations - sequence the build properly - avoid building UI before core logic and data structures exist

Workstream Design Principles

Build core data and logic before advanced UI.

Separate platform foundations from user-facing features.

Deliver the internal sales copilot first.

Keep every workstream testable in isolation.

Treat knowledge quality as a product dependency, not just content work.

40.1 Workstream Overview

40.2 Workstream 1: Platform Foundation

Objective

Create the underlying application infrastructure needed for secure, traceable, versioned operations.

Key Tasks

set up environments: dev, staging, production

implement auth and RBAC

define core database schema

set up audit logging framework

set up file/retrieval storage connectors

set up event bus / queue mechanism

define API versioning approach

implement observability basics (logs, metrics, errors)

Deliverables

environment setup checklist

RBAC matrix

initial database schema migrations

logging and monitoring setup

API gateway/base framework

Dependencies

none, this starts first

Acceptance Criteria

authenticated internal users can access system based on role

all API calls are logged with user/service identity

core objects can be persisted in database

40.3 Workstream 2: Knowledge Core Implementation

Objective

Build the structured knowledge layer and admin-ready data foundations.

Key Tasks

implement services table and CRUD APIs

implement sub-services table and relationships

implement industry playbook table and CRUD APIs

implement discovery question table with conditional fields

implement case-study metadata model

implement scoring config tables

implement knowledge versioning model

build import templates for structured data uploads

Deliverables

service and sub-service APIs

question bank APIs

industry playbook APIs

case-study metadata APIs

versioning schema

admin import template sheets

Dependencies

Platform Foundation

Acceptance Criteria

admin can create and retrieve structured service and question records

knowledge version can be tagged and retrieved by live engine

inactive knowledge does not appear in live recommendations

40.4 Workstream 3: Retrieval and Knowledge Access Layer

Objective

Enable the system to fetch relevant long-form context such as case studies, SOPs, and proposal archives.

Key Tasks

define retrieval corpus types

build document ingestion pipeline for approved files

tag documents with service/industry metadata

implement retrieval APIs

support filtered retrieval by service, industry, geography, and objective

store retrieval trace metadata alongside outputs

Deliverables

retrieval corpus structure

metadata schema

filtered retrieval endpoint

retrieval trace logging

Dependencies

Platform Foundation

Knowledge Core

Acceptance Criteria

system can retrieve relevant case studies based on service and industry filters

retrieval results include source metadata for auditability

40.5 Workstream 4: Orchestration Engine

Objective

Build the decision layer that runs classification, questioning, scoring, and recommendations.

Key Tasks

implement lead classification service

implement field-state manager

implement next-best-question selector

implement duplicate-question prevention logic

implement scoring engine

implement confidence engine

implement recommendation engine

implement proposal-readiness engine

implement escalation rules

Deliverables

orchestrator service

field-state logic

question selection service

scoring service

recommendation service

readiness service

Dependencies

Knowledge Core

Retrieval Layer

CRM field mapping

Acceptance Criteria

system can generate next-best question based on lead state

score updates when critical fields change

recommendation output includes assumptions and risks

low-confidence high-value leads escalate correctly

40.6 Workstream 5: Lead and Discovery APIs

Objective

Expose the engine through stable APIs for UI and integrations.

Key Tasks

build lead intake endpoint

build lead classification endpoint

build discovery session create endpoint

build answer capture endpoint

build score and recommendation endpoints

build proposal-readiness endpoint

build override endpoint

build outcome logging endpoint

Deliverables

API contracts implemented

API validation layer

API error handling and response standards

Dependencies

Orchestration Engine

Platform Foundation

Acceptance Criteria

all critical API flows work in staging

APIs return structured objects matching the contract spec

validation errors are explicit and recoverable

40.7 Workstream 6: CRM & Workflow Integration

Objective

Push lead intelligence into CRM and trigger assignment/action workflows.

Key Tasks

implement CRM create/update sync

implement duplicate lead handling logic

implement owner assignment rules

implement task creation rules

implement SLA tagging

implement sync retry handling and error logging

implement event-triggered workflow updates

Deliverables

CRM sync service

workflow task service

owner assignment engine

SLA priority logic

Dependencies

Lead and Discovery APIs

Event Schema

CRM field mapping

Acceptance Criteria

pilot leads sync into CRM with mapped structured fields

sync failures are logged and retryable

owner assignment follows routing rules

40.8 Workstream 7: Sales Copilot Frontend

Objective

Create the primary working interface for internal sales usage.

Key Tasks

build Lead Intelligence Dashboard UI

build Live Discovery Assistant UI

build score/confidence panels

build missing-field tracker UI

build summary and recommendation cards

build action buttons for assign, escalate, rescore, sync

Deliverables

sales copilot screens

responsive layouts for desktop use

state management for live discovery

Dependencies

Lead and Discovery APIs

scoring and recommendation outputs

Acceptance Criteria

salesperson can complete a structured discovery flow from one interface

UI shows confirmed vs inferred vs missing fields clearly

next-best question can be used during live calls

40.9 Workstream 8: Founder Review Frontend

Objective

Create the escalation review and override interface.

Key Tasks

build review queue screen

build Founder Review Panel

build override form and reason capture

build before/after comparison UI

build override history display

Deliverables

founder review queue

override interaction flow

audit-friendly change display

Dependencies

override APIs

score and recommendation APIs

Acceptance Criteria

founder can review and override an escalated lead quickly

every override is captured with reason and before/after state

40.10 Workstream 9: Knowledge Admin Frontend

Objective

Allow controlled maintenance of services, questions, scoring, and knowledge versions.

Key Tasks

build service management screens

build industry playbook screens

build question-bank editor

build scoring config editor

build publish/rollback version controls

build case-study metadata management interface

Deliverables

admin console for knowledge updates

publish and rollback workflow

Dependencies

Knowledge Core APIs

auth and role controls

Acceptance Criteria

authorized admin can update logic without engineering support

published logic version is visible to live engine and audit logs

40.11 Workstream 10: Analytics, Audit, and Evaluation

Objective

Measure system quality and pilot business impact.

Key Tasks

build lead-quality analytics

build override analytics

build discovery completeness analytics

build question-quality analytics

build conversion-by-score dashboards

build audit trail views

implement model trace storage for major decisions

Deliverables

pilot analytics dashboard

audit export/reporting capability

quality monitoring views

Dependencies

event schema

outcome logging

overrides

Acceptance Criteria

pilot team can review weekly quality and impact metrics

every major decision state has trace metadata available

40.12 Workstream 11: QA, Testing, and Evaluation Harness

Objective

Validate that the system behaves reliably across real AIM scenarios.

Key Tasks

create scenario test library by service and industry

create expected-answer and expected-question test cases

build regression checks for score/routing logic

build duplicate-question test set

build misfit lead test set

run founder-reviewed evaluation cycles

Deliverables

scenario library

acceptance test checklist

regression test suite

pilot issue triage template

Dependencies

all major modules

Acceptance Criteria

core scenarios pass acceptance checks before live pilot expansion

repeated regressions are visible before release

40.13 Suggested Sprint-Level Build Sequence

Sprint A

Platform Foundation

base database schema

auth and roles

event envelope setup

Sprint B

Knowledge Core APIs

import templates

service and question models

Sprint C

Orchestration basics

classification

field-state tracking

next-best question service

Sprint D

scoring engine

confidence engine

recommendation engine

readiness engine

Sprint E

lead/discovery APIs

CRM sync basics

owner assignment

Sprint F

Sales Copilot UI

Lead Intelligence Dashboard

Live Discovery Assistant

Sprint G

Founder Review UI

override flow

analytics basics

Sprint H

hardening, QA, pilot support, weekly logic tuning

40.14 Resourcing Recommendation

Minimum Practical Product Team

1 Product Owner / Product Manager

1 Backend Engineer

1 Frontend Engineer

1 Full-stack or Integration Engineer

1 QA / Test Engineer (shared is acceptable initially)

1 Knowledge Ops / Product Admin

1 Founder / Sales Head reviewer for weekly logic tuning

Optional but Valuable

1 AI / Prompt / Eval specialist

1 Data analyst for pilot measurements

40.15 Build Risk Notes

Likely Risk Areas

weak initial knowledge quality

over-complex orchestration too early

CRM sync mismatch with existing workflow

sales UI becoming too heavy for live usage

lack of consistent override reviews

Recommended Mitigation

keep pilot scope narrow

build observable state and logs first

tune on real lead scenarios weekly

keep human override easy and visible

41. Knowledge Ingestion Plan

This section defines how AIM should convert existing founder knowledge, case studies, service know-how, and past assets into usable Entity Brain knowledge.

The goal is to avoid a common failure mode: uploading lots of documents but not creating usable decision intelligence.

Ingestion Principles

Do not treat raw documents as the final brain.

Normalize critical knowledge into structured entities.

Preserve source links and provenance for every ingested fact.

Separate evergreen logic from temporary campaign-specific data.

Use founder review to validate the first structured versions.

41.1 Knowledge Source Categories

Structured Knowledge Sources

service lists

pricing frameworks

deliverable templates

approval matrices

routing rules

scoring rules

CRM fields

Semi-Structured Sources

proposals

SOWs

capability decks

case study decks

service one-pagers

questionnaire sheets

Unstructured Sources

founder voice notes or explanations

call transcripts

WhatsApp discussions

email threads

internal notes

meeting summaries

Operational Sources

execution SOPs

permission notes

city-level constraints

staffing assumptions

turnaround benchmarks

41.2 What Must Be Structured First

The first structured ingestion wave should prioritize: 1. services and sub-services 2. discovery questions 3. quote-critical inputs 4. feasibility-critical inputs 5. scoring logic 6. routing rules 7. high-value case studies 8. common objections and good responses

This is more important than bulk-importing every old document.

41.3 Ingestion Pipeline Stages

Stage 1: Inventory

Collect and list all existing knowledge assets.

Tasks

create source inventory spreadsheet

identify owner of each source

classify source type

tag source freshness

tag source business relevance

Output

A master inventory of AIM knowledge assets.

Stage 2: Prioritization

Decide what should be ingested first.

Priority Order

high-frequency services

current sales-useful documents

repeatable pricing and discovery logic

proven case studies

founder explanations of nuanced commercial decisions

Output

Ingestion priority backlog.

Stage 3: Extraction

Extract commercially relevant facts and patterns from sources.

Tasks

identify service definitions

identify required questions

identify pricing drivers

identify feasibility dependencies

identify common misfit cases

identify objections and winning pitch angles

identify scoring signals

Output

Raw extracted insight sheets by source.

Stage 4: Normalization

Convert extracted insights into structured objects.

Convert Into

service records

question bank records

case-study records

scoring config records

objection records

proposal module records

feasibility notes

Output

Structured import-ready data.

Stage 5: Validation

Have founder / sales head / ops validate structured data.

Validation Focus

is this commercially true?

is anything important missing?

is this outdated?

does this apply generally or only in specific cases?

Output

Approved version 1 structured knowledge pack.

Stage 6: Publication

Push approved knowledge to live/staging environment.

Output

Published knowledge version with changelog.

41.4 Knowledge Inventory Template

Recommended Columns

source_id

source_name

source_type

owner

service_tags

industry_tags

document_date

current_relevance

ingestion_priority

status

notes

Recommended Status Values

Not Reviewed

Prioritized

Extracted

Normalized

Validated

Published

Archived

41.5 Founder Knowledge Capture Plan

A large part of AIM’s advantage lives in founder reasoning, not documents.

Recommended Capture Methods

structured founder interviews by service

scenario-based workshops

win/loss debrief capture

proposal review deconstruction

override explanation logging during pilot

Best Format for Capture

For each service, ask founders to explain: - when this service is the right fit - when it is the wrong fit - what questions they ask first - what information they must know before quoting - what usually goes wrong - what makes a lead exciting but risky - what they would recommend instead in edge cases

Output

Founder reasoning sheets that can be normalized into rules and question banks.

41.6 Service-by-Service Ingestion Template

For each active service, capture the following: - service name - service description - ideal use cases - non-ideal use cases - best-fit industries - key target audiences - mandatory quote inputs - mandatory feasibility inputs - pricing drivers - common objections - recommended pitch angles - supporting case studies - risk notes - common substitutions or alternatives

This template should be completed before activating a service in pilot scope.

41.7 Case Study Ingestion Template

For each case study, capture: - case_study_id - client category - industry - service used - objective - target audience - geography - campaign scale - execution summary - outcome/result - lessons learned - where this case study is useful in sales - proof assets available

Important Rule

Do not store case studies only as PDFs or slides. Create metadata and structured tags first.

41.8 Proposal and SOW Ingestion Guidance

Past proposals and SOWs are valuable, but they should not be imported blindly.

Extract Only

service scope patterns

exclusions patterns

pricing drivers

deliverable blocks

assumptions patterns

client-specific modifications

Do Not Reuse Blindly

outdated pricing

one-off exceptional commercial concessions

old timelines that no longer reflect ops reality

custom clauses from unusual clients unless explicitly tagged

41.9 Objection and Pitch-Angle Ingestion Plan

The Entity Brain should know not just what AIM sells, but how AIM sells it.

Extract and Structure

common objections by service

common objections by industry

strong responses that work

proof points needed to support the response

when to shift to pilot-first recommendation

when to reposition the service mix

Example Tags

budget objection

timeline objection

feasibility objection

“why this touchpoint” objection

attribution objection

trust / credibility objection

41.10 Ops and Feasibility Knowledge Ingestion

This is critical so sales logic stays grounded.

Capture

permission dependencies by touchpoint

lead-time norms by service

production/fabrication constraints

manpower assumptions

city-specific constraints

compliance or handling considerations

reporting limitations

Why It Matters

Without this layer, the brain will oversell and under-warn.

41.11 Suggested Ingestion Sequence for AIM

Wave 1: Pilot-Critical Knowledge

Product Sampling

IT Park Sampling

RWA Sampling

Mall Sampling

In-Store Sampling

Kiosk Activation

LED Van

related case studies

related objections

related feasibility notes

Wave 2: Expansion Knowledge

retail branding

hybrid solutions

workplace activation variants

college and gym expansions

Wave 3: Advanced Learning Knowledge

call transcripts

win/loss notes

founder override logs

response quality patterns

41.12 Ingestion Roles and Ownership

41.13 Quality Checks for Ingested Knowledge

Before publishing a knowledge pack, confirm: - the service definition is current - the question set is not repetitive - quote inputs are sufficient but not excessive - feasibility notes are grounded in real ops constraints - case-study tags are accurate - scoring signals are commercially sensible - outdated pricing or one-off exceptions are excluded or clearly tagged

41.14 Knowledge Freshness Policy

Recommended Review Frequency

service logic: monthly or when service changes

pricing drivers: monthly or on commercial change

case studies: as new ones become available

feasibility rules: whenever ops constraints change

scoring logic: weekly during pilot, then monthly

Freshness Labels

Current

Needs Review

Archived

Historical Reference Only

41.15 Recommended First 30-Day Ingestion Plan

Week 1

build source inventory

prioritize pilot services

define ingestion templates

Week 2

extract and normalize pilot service logic

capture founder reasoning for pilot services

capture top 10–20 questions per pilot service

Week 3

ingest top case studies and objections

ingest feasibility constraints

validate with founder and ops

Week 4

publish v1 knowledge pack

begin pilot usage

start override-driven refinement cycle

41.16 Common Ingestion Mistakes to Avoid

uploading decks without extracting structured logic

mixing outdated and current pricing assumptions

storing founder insights only in free-text notes

failing to distinguish service rules from client-specific exceptions

skipping ops validation

activating too many services before the pilot logic is stable

41.17 Recommended Next Document

After this engineering breakdown and knowledge ingestion plan, the next strongest documents are: 1. Pilot Operating SOP for Sales, Founder Review, and Ops 2. Figma wireframe prompt / UI spec for prototype creation 3. Engineering estimation sheet by workstream and sprint

These will move AIM from planning into execution governance.

42. Pilot Operating SOP

This section defines how AIM should operate the Entity Brain during the pilot.

The purpose of this SOP is to ensure that the pilot is not treated as only a software test. It must function as an operating system test across sales, founder review, ops validation, and product/admin tuning.

SOP Principles

Sales should use the copilot during real discovery, not only after the call.

Founder review should focus on high-value ambiguity, not routine lead handling.

Ops should validate feasibility signals before overpromising becomes a pattern.

Every override and correction should improve the system.

Weekly review must convert pilot observations into logic updates.

42.1 Pilot Roles and Responsibilities

42.2 Daily Operating Flow

Step 1: Lead Intake

All pilot leads should enter through one of these routes: - direct intake into sales copilot - website lead synced into system - WhatsApp inquiry entered or connected into system

Sales User Action

open or create lead in system

review initial classification

confirm obvious identity details

start discovery session

System Action

create or update lead

classify probable service and industry

begin discovery state

suggest next-best question

42.3 Sales Discovery SOP

When to Use Copilot

Sales should use the copilot during: - first discovery call - WhatsApp clarification chat - email-based requirement clarification - follow-up call before proposal preparation

Sales User Must Do

review the lead summary before speaking

ask suggested questions where relevant

mark answers as confirmed when prospect states them clearly

correct inferred fields if needed

avoid skipping critical questions without reason

check proposal-readiness before asking for internal pricing/proposal prep

Sales User Must Not Do

ignore missing critical fields and still request final proposal

override recommendation without reason

assume inferred fields are confirmed facts

promise feasibility where the system has flagged risk without validation

Minimum Sales Checklist Before Moving Lead Forward

objective captured

target audience captured

geography captured

timeline captured in at least band form

service direction reasonably clear

budget orientation captured or at least discussed

major feasibility blockers flagged if known

42.4 Founder Review SOP

When a Lead Must Be Escalated

Escalate when: - score is high but confidence is low - lead is strategically valuable or marquee - service fit is ambiguous across multiple AIM services - client is pushing for final pricing without enough discovery - feasibility risk is high due to timeline, permissions, or category sensitivity - salesperson is unable to determine commercial direction confidently

Founder Reviewer Must Do

review system summary, score, confidence, and missing fields

assess whether the issue is discovery quality, service fit, or feasibility

approve, edit, or override the system recommendation

record override reason in clear business language

identify whether logic update is needed for similar future cases

Founder Reviewer Must Not Do

rewrite the whole brief without preserving why the system was wrong

bypass logging because the lead seems obvious

let urgent but low-feasibility leads proceed without caution notes

Target Review Time

For standard escalations, founder review should ideally be completed in a short focused window, with a practical goal of rapid turnaround during business hours.

42.5 Ops Validation SOP

When Ops Should Be Involved

Ops should validate when: - permissions are a likely blocker - timeline is aggressive - product handling/storage requirements are unclear - branding/fabrication scope affects feasibility - multi-touchpoint complexity is high - retail or venue approvals are required

Ops Reviewer Must Do

review the relevant lead summary and risk flags

confirm or correct feasibility assumptions

identify hidden ground constraints

flag unrealistic commitments before proposal stage

suggest safer execution model where needed

Ops Reviewer Output

feasible

feasible with caution

not feasible without changes

needs more information

This output should be captured in system notes and reflected in feasibility score updates.

42.6 Sales Head Monitoring SOP

Sales Head Responsibilities

review the day’s high-priority leads

review leads stuck in discovery too long

monitor whether sales team is using the copilot properly

review major override patterns

identify where training vs logic improvement is needed

Daily Review Focus

high-priority leads not yet assigned

high-score leads with missing critical fields

repeated founder escalations of the same kind

low-confidence recommendations on important leads

42.7 Product/Admin Operating SOP

Daily Responsibilities

review system errors

review CRM sync failures

review duplicate lead issues

review major logic failures reported by users

track unresolved pilot bugs

Weekly Responsibilities

prepare pilot metrics summary

prepare top override patterns

prepare top weak-question patterns

prepare top misclassification patterns

prepare knowledge update recommendations

Product/Admin Must Do

maintain issue log with severity

tag issues as product, knowledge, scoring, ops, CRM, or training

ensure approved logic changes move through version control

42.8 Daily Cadence

Start of Day

Sales Head / Product Admin should review: - open high-priority leads - pending escalations - sync failures - prior day unresolved issues

During Day

Sales users should: - use the copilot live during active discovery - escalate only when rule conditions are met - avoid offline notes that never enter the system

End of Day

Sales Head / Product Admin should review: - leads processed during the day - new overrides - leads stuck without next action - recurring missing fields

42.9 Weekly Review Cadence

A structured weekly review is mandatory during the pilot.

Participants

Founder Reviewer

Sales Head

Sales Users in pilot

Ops Reviewer

Product/Admin Owner

CRM Admin if sync issues are material

Weekly Review Agenda

total pilot leads processed

score distribution

confidence distribution

discovery completeness trends

top missing fields

top duplicate or weak questions

top founder overrides

top ops feasibility corrections

notable wins/losses from pilot leads

logic changes to approve for next version

Weekly Output

approved logic updates

training actions for sales users

CRM fixes if needed

list of scenarios to add to test harness

42.10 Lead Handling SOP by Priority Band

High Intent Priority

Sales User: - contact fast within SLA - complete discovery thoroughly - check readiness early

Sales Head: - monitor closely - step in if confidence is low or lead is strategically important

Founder: - review if escalated

Qualified Priority

Sales User: - proceed with standard discovery and proposal path - avoid rushing if critical data missing

Sales Head: - review only if stuck or if lead is large/complex

Nurture / Clarify

Sales User: - focus on missing information - do not move to detailed proposal early

Sales Head: - monitor if lead lingers too long without clarity

Low Priority / Disqualify

Sales User: - re-scope if possible - otherwise mark appropriately

Sales Head: - review only for special strategic exceptions

42.11 Override Handling SOP

When an Override Happens

The responsible reviewer must capture: - what the system said - what was changed - why it was changed - whether the problem was knowledge, scoring, workflow, or UI understanding

Override Categories

service classification correction

scoring correction

feasibility correction

routing correction

proposal-readiness correction

field accuracy correction

Rule

An override is not only an exception. It is a training signal. Every recurring override pattern must be reviewed in weekly logic tuning.

42.12 Proposal Stage Handoff SOP

Before a lead moves to proposal stage, the salesperson must verify: - proposal-readiness status is appropriate - required fields are captured - assumptions are visible - risks are visible - feasibility flags are reviewed if needed

Handoff Package Should Include

requirement summary

confirmed fields

inferred fields

missing but non-blocking fields

score summary

recommended service path

assumptions

risk flags

relevant case studies

This package should be visible to proposal owner or salesperson preparing the proposal.

42.13 CRM Hygiene SOP During Pilot

CRM Admin / Product Admin Must Monitor

duplicate leads

field mismatch between system and CRM

missing mandatory fields after sync

invalid enum values

assignment mismatches

failed tasks or SLA tags

Rule

CRM should remain the operational record, but Entity Brain should remain the decision layer. Neither should silently overwrite the other without auditability.

42.14 Training SOP for Sales Users

Before pilot start, sales users should be trained on: - what the system is trying to do - what confirmed vs inferred means - how to use next-best question suggestions - when to escalate - how to correct fields - how to avoid bypassing the system - how proposal-readiness differs from general interest

Training Format Recommended

one walkthrough session

one scenario-based practice session

one shadow-mode review session

42.15 Pilot Issue Classification SOP

Every issue raised during pilot should be tagged as one of the following: - Knowledge issue - Scoring issue - Question quality issue - CRM sync issue - UI usability issue - Routing issue - Feasibility logic issue - Training issue - Performance/latency issue

This helps avoid vague statements like “the system is not good” and turns feedback into fixable categories.

42.16 Pilot Success Review SOP

At the end of each pilot cycle, leadership should review: - whether founder dependency reduced - whether discovery quality improved - whether high-priority leads were identified earlier - whether feasibility issues were caught earlier - whether sales adopted the system properly - whether logic is stable enough to expand

Expansion Decision Options

expand to more services

expand to customer-facing discovery bot

continue internal-only tuning

pause and fix specific modules before expansion

42.17 Pilot SOP Checklist

Daily Checklist

new pilot leads entered through system

high-priority leads reviewed

pending escalations addressed

sync failures checked

overrides logged

Weekly Checklist

pilot metrics reviewed

top weak questions reviewed

top overrides reviewed

top feasibility corrections reviewed

logic changes approved or deferred

End-of-Pilot Checklist

baseline vs pilot comparison completed

expansion readiness assessed

v2 improvement backlog created

42.18 Recommended Next Document

After this Pilot Operating SOP, the next most useful document is: Figma Wireframe / Prototype Prompt Pack

That will allow AIM to turn this specification into actual screen concepts quickly for design and build alignment.

43. Figma Wireframe / Prototype Prompt Pack

This section converts the AIM Entity Brain product specification into design-ready prompts.

These prompts are intended for: - Figma AI - a product designer - a UI/UX freelancer - low-code UI prototyping tools - internal frontend teams creating first-pass wireframes

Prompt Pack Objective

Generate usable screen concepts for the first version of AIM Entity Brain with: - clean B2B SaaS layout - premium but functional UI - strong information hierarchy - fast decision support for sales and leadership - minimal clutter during live usage

Design Direction

Use a clean, data-driven, premium interface style aligned to AIM’s broader design language: - white or very light backgrounds - dark navy text - AIM blue accents - rounded cards - subtle shadows - clean spacing - high readability - clear chips, tags, and status indicators - dashboard-first layout - modern enterprise SaaS feel

Global UX Principles

Sales must understand a lead in under 30 seconds.

The interface must clearly separate confirmed, inferred, and missing information.

Score, confidence, and proposal-readiness must always be visible.

The UI must support live call usage without forcing too much scrolling.

Important actions must be obvious: ask next question, assign, escalate, override, sync, move to proposal.

AI-generated recommendations must always be visually separable from human-confirmed facts.

43.1 Global Design Prompt

Master Prompt

Design a premium B2B SaaS product called AIM Entity Brain, an AI-powered sales intelligence and discovery copilot for a marketing and activation company. The product helps sales teams qualify leads, ask the right next question, score opportunities, recommend services, identify missing information, and route high-priority leads correctly. The UI should feel modern, clean, premium, and data-driven, with white backgrounds, dark navy typography, AIM-blue accents, rounded cards, light borders, subtle shadows, clean chip-based statuses, and strong information hierarchy. The design must support live sales usage, founder review, and CRM-style workflow. Use a desktop-first layout with modular cards, right-side action panels, sticky score/status areas, and clear separation between confirmed data, inferred data, missing data, recommendations, and risk flags.

43.2 Screen Prompt: Lead Intelligence Dashboard

Prompt

Design a desktop web application screen for Lead Intelligence Dashboard inside AIM Entity Brain. This is the main screen used by sales teams to understand a lead quickly.

The page should include: - top header with lead name, company name, source channel, last updated time, assigned owner - prominent status chips for total lead score, confidence, proposal readiness, SLA priority, escalation flag - left column showing company and contact details, designation, industry, service category, sub-service, geography - central section showing requirement summary, target audience, timeline, budget band, campaign objective, preferred touchpoints - a clear Missing Information card showing unresolved critical fields - a Recommended Next Action card with suggested next step and why it matters - a Solution Recommendation card showing recommended service mix, campaign model, budget band, and top assumptions - a Case Studies / Supporting Proof card - right-side sticky sidebar with score breakdown, confidence explanation, proposal readiness, and quick action buttons - bottom activity timeline with recent interactions, sync events, overrides, and discovery milestones

Use a premium enterprise SaaS style, clean sections, rounded cards, subtle blue highlights, and fast scannability. Make the most important commercial information visible above the fold.

Key UI Elements to Include

score donut or score bar for total lead score

chip-style status labels

collapsible cards for long summaries

quick action buttons: Open Discovery Assistant, Assign Owner, Escalate, Sync CRM, Move to Proposal

visually distinct labels for Confirmed / Inferred / Missing

43.3 Screen Prompt: Live Discovery Assistant

Prompt

Design a desktop screen for Live Discovery Assistant in AIM Entity Brain. This is used by a salesperson during a live call or WhatsApp/email clarification flow.

The screen should feel fast, focused, and minimal-clutter.

The page should include: - left panel showing live transcript or conversation notes - center panel showing Next-Best Question card prominently at the top - below it, a list of alternative questions if needed - a structured answer capture area with editable fields - a Field State Tracker showing confirmed fields, inferred fields, missing critical fields, and recently updated fields - a live Score & Confidence Update panel showing how new answers affect qualification - a Proposal Readiness module that updates live - quick actions to mark answer confirmed, edit field, skip question with

reason, request founder review, generate summary - a compact reasoning explanation under the next-best question, like “This question is needed to estimate campaign scope and pricing band.”

Use clean cards, sticky top question area, a strong center-column interaction area, and a right-side intelligence sidebar. The interface should help a salesperson move smoothly without losing conversation flow.

Key UI Elements to Include

“Next Best Question” highlighted in blue-accent card

inline tags showing Quote Critical / Feasibility Critical / Scoring Critical

animated or clearly visible score changes after answer capture

distinct boxes for Confirmed, Inferred, Missing

a top-right “Escalate for Review” button

43.4 Screen Prompt: Founder Review Panel

Prompt

Design a premium review interface for Founder Review Panel in AIM Entity Brain. This screen is used by a founder or sales head to review high-value or low-confidence leads.

The screen should include: - top header with lead identity, company, strategic account badge if applicable, escalation reason - top row of score cards for total score, confidence, strategic value, feasibility, proposal readiness - left section with system-generated lead summary, discovery summary, missing information, and conversation highlights - central section with System Recommendation card showing recommended service mix, next step, assumptions, risks, and suggested owner - right section with Override Controls to edit fields, change service classification, change owner, adjust readiness, or mark nurture/disqualify - a before/after comparison view when override is being entered - override reason input box - override history section showing previous changes, timestamps, and who made them - bottom timeline for recent decisions and review actions

Make the interface feel high-trust, executive, and low-noise. Use premium card layouts, score emphasis, and clear visual distinction between system recommendation and human override.

Key UI Elements to Include

escalation banner at top

split view: System Recommendation vs Override

mandatory override reason field

approve, edit, and override buttons

audit timeline

43.5 Screen Prompt: Solution Recommendation Panel

Prompt

Design a focused screen for Solution Recommendation Panel in AIM Entity Brain. This screen helps sales understand what to propose and why.

The page should include: - primary recommendation card with recommended service mix and campaign model - secondary alternatives card showing 1–2 alternative service paths - “Why this fits” section listing the business reasons for recommendation - “Budget & Timeline Guidance” card with suggested bands - “Assumptions” card and “Exclusions / Risks” card - supporting case studies panel with thumbnails or compact cards - quick actions: Accept Recommendation, Send to

Proposal Prep, Compare Alternatives, Escalate

The design should feel strategic and commercially intelligent rather than overly technical. Use elegant cards, concise bullets, strong hierarchy, and premium spacing.

Key UI Elements to Include

recommendation confidence chip

info cards for assumptions and exclusions

linked case-study cards

primary CTA button for moving to proposal stage

43.6 Screen Prompt: Knowledge Admin Panel

Prompt

Design an admin console screen for Knowledge Admin Panel in AIM Entity Brain. This panel is used to manage services, industry playbooks, discovery questions, scoring config, case studies, and logic versions.

The page should include: - left navigation for Services, Industries, Questions, Scoring, Case Studies, Versions - main content area showing a table or card list of the selected knowledge object - edit drawer or side panel for updating records - status chips for Active, Draft, Archived, Needs Review - version management controls for publish and rollback - filters for service, industry, status, and owner - a top banner showing current live logic version

The design should feel like a modern internal admin SaaS panel: clean, organized, and efficient.

Key UI Elements to Include

searchable data tables

side-edit panel or modal

publish version button

rollback button

structured field forms

43.7 Screen Prompt: Weekly Pilot Analytics Dashboard

Prompt

Design a desktop analytics dashboard for AIM Entity Brain Pilot Review. This dashboard is used weekly by founder, sales head, and product/admin to assess pilot quality.

The page should include: - KPI cards for leads processed, average completeness score, duplicate question rate, override count, sync failure count, proposal-ready rate - charts for score distribution, confidence distribution, lead status distribution - a panel for top missing fields - a panel for top override categories - a panel for top weak questions or repeated question problems - a panel for conversion by score band - a table of high-risk pilot issues - a weekly action recommendation section

Use a premium analytics UI, clean charts, white background, dark text, restrained AIM-blue accents, rounded metric cards, and highly readable tables.

43.8 Low-Fidelity Wireframe Prompt Pack

Use these prompts when you want simple structural wireframes instead of polished UI.

Low-Fidelity Master Prompt

Create grayscale, low-fidelity wireframes for a B2B SaaS sales intelligence product called AIM Entity Brain. Focus on layout, information hierarchy, and workflow usability rather than visual polish. Use boxes, placeholders, labels, tables, cards, sidebars, tabs, and chips. Show desktop-first screen layouts for lead intelligence, live discovery, founder review, recommendation, and knowledge admin.

Low-Fidelity Screen Prompt: Lead Dashboard

Create a grayscale wireframe for a lead dashboard with a three-column layout: left for lead identity and company info, center for requirement summary and missing info, right for score, confidence, readiness, and action buttons. Include an activity timeline below.

Low-Fidelity Screen Prompt: Live Discovery Assistant

Create a grayscale wireframe for a live discovery screen with left transcript panel, center next-best question and answer capture area, and right field-state tracker with live score changes.

Low-Fidelity Screen Prompt: Founder Review

Create a grayscale wireframe for a founder review screen with escalation banner, summary area, system recommendation panel, override form, and audit timeline.

43.9 Clickable Prototype Flow Prompt

Prompt

Create a clickable prototype for AIM Entity Brain with the following flow: 1. user lands on Lead Intelligence Dashboard 2. clicks Open Discovery Assistant 3. sees next-best question and enters an answer 4. score and readiness update dynamically 5. user returns to dashboard and sees updated summary 6. user opens Solution Recommendation Panel 7. user chooses Escalate for Review 8. founder review screen opens with override controls 9. founder changes service path and submits override 10. dashboard updates with new recommendation and audit entry

The prototype should prioritize business workflow clarity over full UI polish.

43.10 Component Library Prompt

Prompt

Design a component library for AIM Entity Brain using a premium B2B SaaS design system. Include: - status chips - score cards - confidence indicators - summary cards - missing info alerts - field state badges for Confirmed / Inferred / Missing - side panels - activity timeline rows - editable table rows - recommendation cards - escalation banner - override modal - analytics KPI cards

Use consistent rounded corners, subtle shadows, navy typography, blue accents, clean grids, and high readability.

43.11 UX Copy Guidance for Prototype

Use short, professional labels and helpful assistant-style system text.

Suggested Label Examples

Lead Intelligence

Discovery in Progress

Recommended Next Step

Missing Critical Information

Proposal Readiness

High Intent Priority

Needs Human Review

Confirmed Information

Inferred Information

Escalation Reason

Recommended Service Mix

Why This Fits

Risks & Assumptions

Suggested Helper Text Examples

This question helps determine campaign scope and budget fit.

More information is needed before a scoped proposal can be prepared.

This lead is high-value, but confidence is low due to missing commercial details.

Feasibility should be validated before final commitment.

43.12 Recommended Prototype Build Order

Create design concepts in this order: 1. Lead Intelligence Dashboard 2. Live Discovery Assistant 3. Founder Review Panel 4. Solution Recommendation Panel 5. Knowledge Admin Panel 6. Weekly Pilot Analytics Dashboard

This sequence matches the highest-value usage path for AIM.

43.13 Recommended Next Deliverables

After this prompt pack, the next strongest execution outputs are: 1. a Figma file or clickable prototype 2. an engineering estimation sheet by workstream 3. a knowledge ingestion tracker spreadsheet 4. a pilot-ready issue tracker template

At this point, AIM has enough specification depth to begin design, estimation, and phased build execution.

44. Knowledge Ingestion Operating Model

This section turns knowledge ingestion from a concept into a working operating model for AIM.

The goal is to make sure AIM can continuously convert: - founder knowledge - service know-how - case studies - proposals - SOWs - ops constraints - sales conversations - objections and rebuttals

into structured, versioned, usable Entity Brain knowledge.

Operating Model Principles

Ingestion is a recurring business process, not a one-time upload project.

Every important knowledge item should move through a defined workflow.

Nothing should become live without validation.

Every structured record must retain source provenance.

High-frequency commercial knowledge should be ingested first.

44.1 Knowledge Ingestion Workflow

Stage 1: Capture

Collect raw knowledge from founders, sales, ops, proposals, decks, and transcripts.

Stage 2: Inventory

List and tag the source with metadata.

Stage 3: Extract

Pull out commercially meaningful facts, patterns, conditions, and rules.

Stage 4: Normalize

Convert extracted points into structured entities.

Stage 5: Validate

Get service owner / founder / ops approval.

Stage 6: Publish

Push validated logic into active or draft knowledge version.

Stage 7: Monitor

Track where the ingested knowledge performs well or poorly in live usage.

Stage 8: Refresh

Update or retire stale knowledge.

44.2 Recommended Knowledge Repositories

AIM should maintain four distinct knowledge repositories.

Repository A: Structured Core Knowledge

Stores: - services - sub-services - discovery questions - scoring rules - routing rules - feasibility notes - objections - proposal modules

Repository B: Retrieval Knowledge

Stores: - case studies - decks - SOWs - proposal archives - transcripts - internal playbooks

Repository C: Working Draft Knowledge

Stores: - extracted but unvalidated records - founder interview notes - pending logic proposals - staging-only updates

Repository D: Historical / Archived Knowledge

Stores: - old logic versions - retired services - outdated pricing patterns - historical references

44.3 AIM-Specific Knowledge Domains to Ingest

Domain 1: Commercial Service Knowledge

what AIM sells

where each service fits

where it does not fit

what is required before quote

what is required before feasibility validation

Domain 2: Touchpoint Intelligence

IT parks

RWAs / apartments

malls

retail stores

colleges

gyms

LED vans

hybrid combinations

Domain 3: Industry Intelligence

FMCG

snacks / foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care

Domain 4: Sales Discovery Intelligence

must-ask questions

disqualifying signals

upsell signals

pilot vs rollout signals

budget discovery patterns

Domain 5: Delivery / Ops Intelligence

permissions

lead times

staffing assumptions

fabrication dependencies

city-level constraints

reporting realities

Domain 6: Case Study and Proof Intelligence

what proof to use for which lead

which results matter by category

what kind of case study helps which objection

Domain 7: Objection and Rebuttal Intelligence

budget objections

trust objections

timing objections

attribution objections

feasibility objections

“why this touchpoint” objections

44.4 Knowledge Item Types

Each ingested item should be classified into one of these types.

44.5 Detailed Source Inventory Template

Use this structure for every potential source.

44.6 Extraction Template by Source

When extracting from any source, capture the following.

44.7 Normalization Templates

A. Service Logic Normalization Template

service_name

sub_service_name

description

ideal_use_cases

non_ideal_use_cases

best_fit_industries

best_fit_audiences

44.8 Knowledge Validation Workflow

Validation Levels

Level 1: Content Validation

Checks whether the extracted content is understandable and correctly structured. Owner: Product/Admin

Level 2: Commercial Validation

Checks whether the logic matches real sales and founder thinking. Owner: Founder / Sales Head

Level 3: Feasibility Validation

Checks whether the guidance is operationally realistic. Owner: Ops Lead

Level 4: Publication Validation

Checks whether the item is ready for live logic versioning. Owner: Product/Admin + designated approver

Validation Status Options

Draft

Needs Commercial Review

Needs Feasibility Review

Approved for Staging

Approved for Live

Rejected

Archived

44.9 Knowledge Review SLAs

To prevent ingestion backlog from piling up, use practical turnaround targets.

44.10 AIM Knowledge Backlog Structure

AIM should maintain the ingestion backlog in four buckets.

Bucket A: Pilot-Critical Now

Needed before or during pilot.

Bucket B: High-Value Next

Strong value but not needed on day one.

Bucket C: Expansion Later

Useful for broader product scale after pilot stability.

Bucket D: Historical / Research

Useful for reference but not urgent to normalize.

44.11 Recommended AIM Pilot Knowledge Backlog

Bucket A: Pilot-Critical Now

Product Sampling — core definition

IT Park Sampling logic

RWA / Apartment Sampling logic

Mall Sampling logic

In-Store Sampling logic

Brand Activation — kiosk / demo logic

LED Van campaign logic

Top 5 beauty/skincare case studies

Top 5 FMCG/snack/beverage case studies

Top budget objections and responses

Top feasibility blockers by service

Founder scoring/routing signals for high-value leads

Bucket B: High-Value Next

Retail branding

Hybrid campaign solution logic

College sampling expansion

Gym / fitness outreach expansion

Menstrual hygiene campaign nuances

Pet care targeting logic

Additional case study tagging

Bucket C: Expansion Later

voice-call transcript intelligence

email thread mining

long-term win/loss patterns

advanced proposal-block recommendations

Bucket D: Historical / Research

old proposals with outdated pricing

one-off client exception SOWs

historical services no longer central to AIM

44.12 AIM First 25 Knowledge Tasks

Below is a practical starter backlog.

44.13 Founder Interview Pack for Ingestion

Use this structured format when capturing founder knowledge.

Founder Interview Questions by Service

When is this service the best fit?

When is this service a weak fit?

What are the first three questions you ask?

What information must you know before quoting?

What makes you cautious about this type of lead?

What signals tell you the lead is serious?

What common mistakes do salespeople make with this service?

What objections come up most often?

What is the best fallback or pilot option when scope is unclear?

Which case study do you usually reference and why?

Output from Each Interview

service rules

discovery questions

scoring signals

objection-response pairs

case study mapping

feasibility warnings

44.14 Sales Debrief Capture Format

Sales users should log structured insights after important calls.

Capture Fields

lead_id

service discussed

what questions worked well

where the prospect got confused

what objection came up

what information was hard to get

what the system got right

what the system got wrong

whether founder help was needed

recommendation for logic update

This is one of the best sources for real-world ingestion improvement.

44.15 Ops Debrief Capture Format

Ops should contribute not only when something fails, but as a proactive ingestion source.

Capture Fields

service / touchpoint

what feasibility assumption was unrealistic

what information sales missed

what timeline assumptions were wrong

what permission dependency was critical

what product handling concern existed

what future question should be asked earlier

44.16 Knowledge Freshness and Retirement Rules

A knowledge item should be marked “Needs Review” when:

pricing drivers change materially

permissions reality changes

a service definition changes

repeated overrides challenge the same rule

a case study becomes outdated or less relevant

A knowledge item should be archived when:

service is no longer actively sold

case study is no longer commercially useful

logic is replaced by a better version

pricing assumptions are obsolete and misleading

44.17 Knowledge Quality Scorecard

Each ingested knowledge item can be rated before publication.

Suggested Publication Rule

Only items with acceptable ratings across all core dimensions should move live.

44.18 Knowledge Ingestion Cadence Recommendation

Daily

capture new important insights from sales and ops

tag new useful source materials

Weekly

normalize priority items

review overrides and convert them into candidate logic updates

publish approved micro-updates if safe

Monthly

review service logic freshness

review question-bank effectiveness

archive stale knowledge

refresh case study relevance

44.19 Knowledge Ops Ownership Model

If AIM wants this system to stay strong, one person should effectively own knowledge operations.

Recommended Knowledge Ops Owner Responsibilities

maintain source inventory

coordinate extraction and normalization

chase reviews and approvals

ensure freshness and archive stale logic

prepare weekly knowledge update recommendations

track ingestion throughput and bottlenecks

This role can initially be handled by Product/Admin.

44.20 Recommended First Working Session Agenda

For AIM’s first hands-on knowledge ingestion workshop, run this agenda:

Session 1: Product Sampling Core (90–120 min)

define Product Sampling v1

define IT Park, RWA, Mall, In-Store variants

list quote-critical inputs by variant

list feasibility-critical inputs by variant

list top objections by variant

list strongest case studies by variant

approve draft discovery questions

Session 2: Activation + LED Van (60–90 min)

define kiosk activation logic

define product demo logic

define LED van logic

list misfit cases

approve scoring cues and escalation signals

Session 3: Industry Plays (60–90 min)

beauty/skincare

FMCG/snacks/beverages

wellness

baby care / menstrual hygiene where relevant

44.21 Recommended Next Output

The best practical next artifact after this operating model is: a Knowledge Ingestion Tracker with columns, statuses, owners, and the first AIM backlog pre-filled

That will convert this plan into an actual working tool for the team.

45. Service-by-Service Ingestion Pack

This section provides the actual ingestion packs AIM can use service by service.

Each pack is designed to help AIM move from raw founder knowledge and past documents into: - structured service records - discovery question banks - feasibility notes - objection-response pairs - case-study tags - proposal modules - scoring signals

How to Use This Section

For each service pack: 1. review the service definition internally 2. gather the recommended source materials 3. run founder / sales / ops capture session 4. normalize outputs into structured records 5. validate the pack before publishing it into the live knowledge version

Standard Pack Structure

Each service pack includes: - service purpose - what the Entity Brain must know - source materials to collect - founder capture prompts - sales capture prompts - ops capture prompts - structured entities to create - validation checklist - publication readiness checklist

45.1 Pack 1 — Product Sampling (Core)

Service Purpose

This is the parent commercial service. It defines AIM’s overall product sampling capability, where trial-based brand outreach is used to drive awareness, first use, consideration, and in some cases conversion or measurable response.

What the Entity Brain Must Know

what product sampling means in AIM’s context

what business objectives product sampling solves

which industries are best suited

which touchpoints are available under product sampling

where sampling is a weak fit

what must be known before quoting

what must be known before confirming feasibility

what proof/case studies to show by industry or touchpoint

Recommended Source Materials

AIM sampling service decks

founder explanations of sampling model

past sampling proposals and SOWs

sample budgets or cost breakups

case studies from beauty, FMCG, wellness, beverage, baby care, etc.

past client requirement notes

WhatsApp/email threads where sampling approach was explained

Founder Capture Prompts

In AIM terms, what exactly counts as product sampling and what does not?

When do you immediately know sampling is the right recommendation?

When do you avoid recommending sampling?

What are the top 5 questions you ask first?

What do you need before giving even a budgetary estimate?

Which touchpoints do you mentally shortlist first by category?

What makes a product sampling brief weak or risky?

What kind of client expectation usually creates trouble later?

Sales Capture Prompts

What type of brands ask for sampling most often?

What information do prospects most often fail to provide?

Which objections come up early most often?

What questions usually open up a better conversation?

Where do you most often need founder help today?

Ops Capture Prompts

What are the most common feasibility blockers in sampling?

Which handling or permission issues are often missed by sales?

What lead-time assumptions are most often unrealistic?

What reporting expectations should be carefully managed?

Structured Entities to Create

Product Sampling service record

parent discovery question set

universal quote-critical input set

universal feasibility-critical input set

universal sampling objections set

universal sampling scoring cues

touchpoint decision matrix

case-study map by industry and objective

Validation Checklist

service definition is clear and non-generic

best-fit industries are captured

clear misfit logic exists

all child touchpoints are referenced consistently

quote-critical inputs are complete but not excessive

feasibility notes reflect real delivery constraints

Publication Readiness Checklist

parent service record approved

universal sampling question bank approved

top 3 case studies tagged

pilot scoring cues approved

founder escalation signals approved

45.2 Pack 2 — IT Park Sampling

Service Purpose

Sampling executed in office parks, tech parks, or workplace clusters to reach working professionals and employee audiences.

What the Entity Brain Must Know

who this touchpoint is best for

when IT parks outperform malls or RWAs

premium vs volume-focused park choices

kiosk vs promoter-led distribution options

branding dependencies

employee audience fit by category

permission and access realities

Ideal Use Cases

beauty / skincare targeting working professionals

beverages and wellness products for office-going consumers

premium FMCG trial among salaried urban audience

product education in controlled weekday environments

Common Misfit Cases

products with no working-professional relevance

very low sample quantity requests where park access effort is too high

brands demanding very broad general household reach

extremely urgent campaigns with no time for park approvals/access coordination

Recommended Source Materials

past IT park proposals

lists of past venue types or corporate parks used

photos / proof of previous activations

staffing notes

permission notes and timelines

case studies with office-going TG

Founder Capture Prompts

When do you choose IT parks over malls or apartments?

What kind of products work best here?

How do you distinguish premium parks vs high-volume parks?

What does the client need to clarify before pricing is meaningful?

What usually gets underestimated in this touchpoint?

Sales Capture Prompts

What target-audience descriptions signal a strong IT park fit?

What questions help reveal whether the client wants interaction or only distribution?

What confusion do prospects typically have about office park access or quality of audience?

Ops Capture Prompts

How much lead time is typically needed?

What permissions or coordination models commonly apply?

What branding / setup limitations exist on site?

What manpower assumptions are realistic?

Structured Entities to Create

IT Park Sampling sub-service record

quote-critical question set

feasibility note set

premium-vs-volume venue assumptions guide

objections specific to workplace outreach

beauty/wellness/FMCG case-study tag group

Validation Checklist

working-professional TG logic is explicit

premium / scale differentiation is captured

permission model is described accurately

site setup options are clearly defined

Publication Readiness Checklist

one premium audience case study tagged

one volume-focused case study tagged

founder-approved must-ask questions loaded

feasibility notes validated by ops

45.3 Pack 3 — RWA / Apartment Sampling

Service Purpose

Sampling conducted in residential communities, apartment complexes, or gated societies to reach households and family decision-makers.

What the Entity Brain Must Know

which household-oriented categories fit best

how to distinguish premium apartments vs broad family communities

gate activity vs kiosk vs deeper engagement formats

society permissions reality

household decision-maker targeting logic

where residential outreach is a poor fit

Ideal Use Cases

baby care

household FMCG

family-use personal care products

food trial for family or community consumption

products where homemakers / parents / households matter

Common Misfit Cases

youth-only products with weak household relevance

categories better suited to workplace or college contexts

campaigns with no tolerance for society approvals or timing limits

premium niche categories that need a more controlled aspirational environment

Recommended Source Materials

apartment activation proposals

pricing sheets by society count or manpower model

permission notes

earlier residential campaign proofs

community-wise targeting notes if available

Founder Capture Prompts

What are the strongest buying situations for RWA sampling?

What signals tell you a client actually needs residential reach rather than mall or retail reach?

What are the first three things you ask about scale and society profile?

When do you reject or redirect the lead?

Sales Capture Prompts

What do prospects usually misunderstand about RWA execution?

What info is usually missing when they ask for pricing?

Which objections or hesitations come up most often?

Ops Capture Prompts

What permission models differ across apartments?

What timing rules or society restrictions are common?

What staffing assumptions or transport considerations matter?

Structured Entities to Create

RWA / Apartment Sampling sub-service record

society-type segmentation notes

quote-critical questions by residential model

permission dependency notes

household-relevance scoring cues

objections around permissions / community access / value perception

Validation Checklist

household TG logic is strong

premium vs broad-community distinction is captured

permission issues are realistic

scale planning logic is usable for quoting

Publication Readiness Checklist

at least 2 residential campaign examples tagged

key objections and responses approved

risk notes validated by ops

45.4 Pack 4 — Mall Sampling / Mall Activation

Service Purpose

Sampling or trial activity inside malls or public premium venues, often supported by kiosk, promoter interaction, or branded setup.

What the Entity Brain Must Know

when mall activation is worth recommending

premium-mall vs high-footfall-mall logic

kiosk vs promoter-only formats

branding/fabrication impact on cost and feasibility

demo-led vs handout-led differences

weekend vs weekday considerations

Ideal Use Cases

beauty / skincare

premium personal care

beverage, food, and new launches needing mass trial

products benefitting from visible public engagement

brands wanting premium perception plus reach

Common Misfit Cases

very low budgets for premium venues

products with no shopper interaction value

client not ready for branding/fabrication cost implications

B2B products with poor consumer venue relevance

Recommended Source Materials

mall activation proposals

fabrication cost sheets

mall permission notes

staffing models

photos and case studies

existing premium-vs-footfall venue notes

Founder Capture Prompts

When do you recommend mall before IT park or retail?

How do you distinguish premium need vs simple volume need?

What is the minimum information needed before pricing?

When do branding requirements materially change the solution?

Sales Capture Prompts

What do prospects usually ask first about malls?

What do they misunderstand about cost drivers?

Which questions help uncover whether a kiosk is really needed?

Ops Capture Prompts

What permissions, setup, or power needs matter most?

What fabrication turnarounds are realistic?

What site constraints affect demo-led activity?

Structured Entities to Create

Mall Sampling / Activation sub-service record

venue-tier logic notes

kiosk-vs-promoter scope rules

branding/fabrication cost driver notes

weekend/weekday planning assumptions

mall-specific objections and responses

Validation Checklist

venue tier logic is explicit

cost drivers are accurately captured

kiosk vs promoter-only differentiation is clear

demo/compliance concerns are noted where relevant

Publication Readiness Checklist

one premium mall case study tagged

one broad-footfall mall example tagged

fabrication notes validated by ops

45.5 Pack 5 — In-Store / Retail Sampling

Service Purpose

Sampling or product trial executed inside retail stores to influence shopper conversion, product education, and sell-out.

What the Entity Brain Must Know

when in-store is stronger than mall or residential

retailer / chain approval dependence

store count and chain specifics as cost drivers

demo / educate / distribute staffing differences

shelf / in-store conversion use case

store-level reporting expectations

Ideal Use Cases

launch support in modern trade or chain stores

sell-out push

shopper education for new or unfamiliar products

categories where point-of-purchase trial matters strongly

Common Misfit Cases

no retailer tie-up or unclear store access

no list of stores or chain context

client expects instant conversion attribution without retail control

extremely low store count with disproportionate approval effort

Recommended Source Materials

retail sampling proposals

store-level campaign reports

retailer-specific notes if available

approval dependencies

promoter training notes

case studies from retail chain activations

Founder Capture Prompts

When is in-store the right answer instead of mall or IT parks?

What do you need to know before even giving an initial estimate?

How do you judge whether the client has real retail access?

What kinds of products benefit most from in-store demo or education?

Sales Capture Prompts

What questions reveal whether retailer approval is real or assumed?

What common confusion exists between in-store branding and in-store sampling?

What are the most common client goals here: sell-out, awareness, education?

Ops Capture Prompts

What data is required from stores before execution?

What installation/demo rules matter on ground?

How do staffing/training assumptions change by category?

Structured Entities to Create

In-Store / Retail Sampling sub-service record

retailer approval logic notes

quote-critical question set by chain/store scenario

training-level / promoter-role notes

store-count pricing drivers

retail-specific objections and proof assets

Validation Checklist

store access dependency is explicit

conversion vs education objective split is clear

retailer-approval logic is realistic

staffing differences are captured

Publication Readiness Checklist

one retail-chain case study tagged

store/chain logic validated by sales and ops

must-ask questions approved

45.6 Pack 6 — Kiosk-Based Brand Activation / Product Demo Booth

Service Purpose

Interactive branded activation designed to attract attention, engage audiences, demonstrate the product, and support trial or education.

What the Entity Brain Must Know

when simple sampling should become a fuller activation

kiosk vs light branded setup vs promoter-only model

demo-led vs gamified vs engagement-led activation

branding/fabrication requirements

staff/training expectations

venue-space and power requirements

Ideal Use Cases

product launches needing interaction

categories requiring demonstration or education

premium public or retail environments

campaigns aiming for stronger recall than handout-only distribution

Common Misfit Cases

clients wanting only passive visibility with no interaction

no tolerance for fabrication or branding budget

very small-scale brief where a kiosk is overkill

categories with heavy demo/compliance restrictions not yet thought through

Recommended Source Materials

kiosk activation proposals

demo booth budgets

fabrication vendor templates

staff role descriptions

game / engagement format notes

execution photos and case studies

Founder Capture Prompts

What makes you move from sampling to activation?

What signs tell you the client needs engagement, not just distribution?

What are the most common activation formats AIM should standardize?

When does the kiosk become too heavy or unnecessary for the brief?

Sales Capture Prompts

What client words or goals signal this is really an activation brief?

What discovery questions help uncover branding or engagement expectations?

Which client misunderstandings about cost and complexity are most common?

Ops Capture Prompts

What setup requirements matter most on site?

What dependencies exist around fabrication, power, storage, transport, staff training?

What kind of lead times are realistic by venue type?

Structured Entities to Create

Kiosk Activation sub-service record

demo / gamification / education decision notes

branding/fabrication module rules

venue dependency notes

activation-specific objections and responses

proposal modules for kiosk scope variants

Validation Checklist

activation-vs-sampling distinction is clear

heavier-scope dependencies are captured

staffing and training assumptions are usable

venue dependency notes are grounded

Publication Readiness Checklist

at least 2 activation case studies tagged

fabrication module logic approved

ops risk notes reviewed

45.7 Pack 7 — LED Van / Mobile Outreach

Service Purpose

Vehicle-led mobile visibility or route-based campaign used for awareness, launch buzz, route coverage, or branch/hotspot-based exposure.

What the Entity Brain Must Know

when LED van solves the client’s objective and when it does not

route-based awareness logic

duration, city, and vehicle-type cost drivers

permissions and operating-hour realities

route planning needs

whether client wants visibility only or additional support like audio/promoter/branding

Ideal Use Cases

city-wide visibility bursts

launch buzz

route-specific awareness around branches, hotspots, events, or neighborhoods

quick reach-focused campaigns where awareness is the main job

Common Misfit Cases

clients expecting direct measurable conversion without support layers

no clarity on route, city, or duration

unrealistic immediate deployment when vehicle availability is constrained

clients needing deep interaction instead of visibility

Recommended Source Materials

LED van proposals

city-wise rate cards or budgets

route planning notes

vehicle availability notes

permission notes

photos / video proofs

Founder Capture Prompts

When do you recommend LED van over static media or on-ground activation?

What are the main commercial drivers for pricing and recommendation?

What is commonly misunderstood by clients about this format?

When should the lead be re-scoped because expectation is wrong?

Sales Capture Prompts

Which questions expose whether the client wants awareness or performance?

What do clients often fail to provide about routes, days, and city needs?

What objections usually come up around cost or utility?

Ops Capture Prompts

What availability and permission realities differ by city?

What are the standard operating assumptions around kilometers, hours, driver, fuel, tolls?

What lead-time caveats matter most?

Structured Entities to Create

LED Van / Mobile Outreach sub-service record

city / duration / route cost driver set

awareness-fit scoring cues

expectation-mismatch objection library

route planning note set

ops assumptions record by city where possible

Validation Checklist

route/visibility logic is clear

performance-vs-awareness expectation issue is captured

city-specific feasibility notes exist where possible

standard operating assumptions are explicit

Publication Readiness Checklist

at least 1 Bangalore and 1 Hyderabad example or note set if available

cost-driver structure approved

sales must-ask questions approved

45.8 Cross-Pack Standard Output Checklist

For every service pack before publication, AIM should have these minimum outputs: - 1 approved service record - 1 approved discovery question set - 1 approved quote-critical input list - 1 approved feasibility-critical input list - 1 approved risk / constraint note set - 1 approved objections-and-response set - 1 approved scoring cue set - at least 1 case study tagged, ideally 2+ - founder reviewer sign-off - ops sign-off if execution-sensitive

45.9 Cross-Pack Working Session Format

Session Format per Service

Duration: 45–75 minutes per service pack

Suggested Agenda

define the service in AIM terms

identify best-fit vs weak-fit use cases

finalize mandatory discovery questions

finalize quote-critical fields

finalize feasibility-critical fields

capture common objections

shortlist proof/case studies

note the top risk patterns

define escalation situations

approve draft structured records

45.10 Recommended Working Sequence for AIM

Use this order for the first ingestion cycle: 1. Product Sampling (Core) 2. IT Park Sampling 3. RWA / Apartment Sampling 4. Mall Sampling 5. In-Store / Retail Sampling 6. Kiosk Activation 7. LED Van / Mobile Outreach

This sequence matches the highest-value pilot logic already defined.

45.11 Recommended Next Artifact

After this service-by-service pack, the best next artifact is: a filled Knowledge Ingestion Tracker with these service packs broken into actionable rows, owners, and due dates

That will let AIM immediately begin execution service by service.

46. Filled Service-Record Pack — Product Sampling (Core)

This section provides the first fully filled service-record pack for AIM Entity Brain.

It is written in a format that can be directly used by: - Product/Admin during ingestion - founders during validation - engineering while shaping the knowledge schema - sales while understanding what the system should know

This is the parent service record for Product Sampling. Sub-services such as IT Park Sampling, RWA Sampling, Mall Sampling, and In-Store Sampling should inherit from this parent logic and add service-specific variations.

46.1 Service Record Header

46.2 Service Definition

Working Definition

Product Sampling is AIM’s controlled brand trial service where products are introduced directly to relevant target consumers through selected touchpoints to drive product trial, awareness, education, and in some cases measurable response.

What This Service Includes

touchpoint recommendation based on target audience and objective

planning and execution of sample handout or trial activity

promoter-led or setup-led consumer engagement where relevant

basic or advanced reporting depending on campaign scope

optional consumer feedback capture

optional conversion support mechanisms such as QR, couponing, or redemption-linked flow when commercially and operationally appropriate

What This Service Does Not Automatically Include

guaranteed sales outcome

guaranteed direct attribution unless agreed system exists

heavy fabrication or activation scope unless explicitly added

retail approvals unless explicitly in scope

consumer database capture unless explicitly designed and approved

46.3 Parent Business Objectives Solved

Product Sampling should be recommended when the prospect’s goal includes one or more of the following: - product trial - awareness through physical experience - new product launch support - target-group-specific introduction - category education - sell-out assistance in supported environments - feedback collection after trial - trial-to-consideration movement

Strongest Use Cases

launch-stage trial generation

D2C or brand awareness campaigns needing first-use experience

FMCG and personal care campaigns where sampling reduces purchase hesitation

wellness and nutrition campaigns where direct trial improves trust and conversion potential

Weak Use Cases

purely passive branding with no trial intention

clients seeking guaranteed measurable conversion without measurement infrastructure

products with severe handling/compliance constraints but no supporting execution design

clients expecting immediate quote without basic scope details

46.4 Best-Fit Industry and Category Logic

Best-Fit Industries

FMCG

snacks and foods

beverages

beauty and skincare

personal care

wellness and nutrition

baby care

menstrual hygiene

pet care (select use cases)

Best-Fit Product Traits

trial improves adoption

tactile / sensory experience matters

first-use hesitation exists

product education improves acceptance

category has broad or clearly segmentable audience

Weak-Fit Product Traits

very technical B2B-only offering

category requires regulated or complex demo environment not yet scoped

target audience cannot be accessed through any practical touchpoint available to AIM

46.5 Fit and Misfit Logic

Strong Fit Signals

product needs real-world trial to improve conversion

client is open to target-group-specific touchpoints

campaign objective is trial, awareness, or education

client can define city, audience, and rough scale

budget can support execution logistics and staffing

Moderate Fit Signals

client wants awareness but is still exploring formats

budget is unclear but pilot openness exists

touchpoint is not yet selected but target audience is clear

Misfit Signals

no clear audience and no willingness to refine it

client wants direct outcome guarantees beyond service control

budget is severely unrealistic for desired scale

timeline is too short for permissions/access-dependent model

product/venue mismatch is high

46.6 Target Audience Logic

Product Sampling should force the system to reason about target audience before touchpoint recommendation.

Primary Audience Dimensions to Capture

age band

gender relevance if any

life stage

professional vs household vs student audience

premium vs mass orientation

geographic concentration

category affinity

Target-Audience-Driven Touchpoint Examples

working professionals → IT parks / workplace outreach

households / parents → RWAs / apartments / select retail

premium shoppers → malls / premium retail / selective workplace clusters

youth / Gen Z → colleges / events / youth-heavy spaces

wellness users → gyms / fitness spaces / premium workplace clusters

46.7 Parent Discovery Question Bank

These questions should load as parent-level discovery for any Product Sampling inquiry.

46.8 Quote-Critical Inputs

The system should not move this service toward serious budgetary recommendation unless most of the following are known: - product category - target audience - geography - timeline band - sample volume or scale band - preferred touchpoint or touchpoint recommendation path - campaign model (pilot / rollout) - budget orientation or willingness to be guided by recommended model

Minimum for Capability Deck

objective known

target audience known

geography known

service fit broadly clear

Minimum for Budgetary Estimate

above fields known

scale roughly known

timeline known

budget orientation at least partially understood

Minimum for Scoped Proposal

all above plus clearer touchpoint mix, staffing depth, and feasibility signal

46.9 Feasibility-Critical Inputs

Before the system increases confidence materially, it should consider the following: - permission dependency by chosen touchpoint - product handling requirements - temperature / tasting / demo constraints if any - timeline realism - promoter/staffing need - branding/setup scope if applicable - city-level ops availability - reporting or data capture expectation complexity

Common Feasibility Risks

timeline too short for permission-heavy environments

fragile or perishable product with no handling plan

client expects data capture in settings where compliance or practicality is weak

mismatch between chosen touchpoint and actual audience concentration

46.10 Pricing Driver Logic

At parent level, the system should know that Product Sampling pricing is typically influenced by: - touchpoint type - city and geography spread - sample volume - campaign duration -

promoter/manpower need - setup / kiosk / branding requirement - permissions dependency - reporting complexity - handling complexity of sample product - campaign scale (pilot vs rollout)

Important Rule

Parent Product Sampling record should not contain final pricing. It should only contain pricing drivers and pricing logic hooks for child services.

46.11 Common Objections and Recommended Responses

Response Principles

do not defend too early; first understand the concern

convert vague objections into decision criteria

use pilot framing where uncertainty is high

only promise reporting depth that can be supported by execution model

46.12 Parent Scoring Cues

Positive Scoring Signals

clear objective for trial / awareness / education

defined target audience

realistic campaign horizon

scale large enough to justify organized execution

openness to pilot structure

category with strong historical fit

willingness to consider recommended touchpoints

Negative Scoring Signals

no audience clarity

unrealistic expectation of guaranteed conversion

severe budget mismatch

urgency without operational realism

product with unaddressed handling constraints

unwillingness to discuss scale or campaign objective

Strategic Value Signals

known or emerging category brand in a high-fit industry

strong case-study value

multi-city expansion potential

repeat sampling potential across launches / variants

46.13 Parent Recommendation Logic

When Product Sampling is selected at parent level, the system should next determine which child path is most appropriate.

Child Path Selection Logic

workplace audience → IT Park Sampling / Corporate Outreach

household or parent audience → RWA / Apartment Sampling

premium public reach → Mall Sampling

shopper conversion objective → In-Store / Retail Sampling

youth-first brief → College Sampling

fitness/wellness audience → Gym Sampling

hybrid or multi-segment brief → Hybrid Campaign Solution

Parent Recommendation Output Style

The system should say: - “Product Sampling is a strong parent fit.” - then recommend child path(s) with reason - then show assumptions and missing inputs before final scoping

46.14 Risk Flags

The system should explicitly warn when: - product category and venue appear mismatched - target audience is too broad for current scope - timeline may not support permissions or setup - scale is too low for chosen touchpoint economics - attribution expectations exceed planned campaign design - sample handling requirements are still unclear

46.15 Parent Case Study Tagging Guidance

Case studies attached to this parent service should be tagged by: - industry - objective - touchpoint - geography - audience type - scale band - reporting depth

Priority Case Study Buckets Needed First

beauty / skincare sampling

FMCG / snack / beverage sampling

wellness / nutrition sampling

family / household sampling

premium audience sampling

46.17 Validation Checklist — Filled

46.18 Publication Readiness Checklist — Pending Actions

Before this Product Sampling parent record goes live, AIM should complete the following: 1. founder review and wording approval 2. sales-head review of objections and discovery questions 3. ops validation of feasibility risks and handling constraints 4. case-study mapping for at least 3 strong parent references 5. confirmation of child-service inheritance model in knowledge schema 6. approval of parent scoring cues and escalation triggers

46.19 Recommended Immediate Next Pack

After this filled Product Sampling parent record, the next best record to fill is: IT Park Sampling

Reason: - it is one of AIM’s highest-value sampling variants - it frequently needs nuanced founder judgment - it will help validate how parent-child service inheritance should work in the Entity Brain
